I think that might come as a surprise to Mark Williams Co.
They're doing a land-office business* selling Coherent, a small
Unix-like operating system for the IBM-PC and clones.

They may have kissed off the Atari market, though.

Other companies have not done so. In fact, I understand there's a new
SAS C compiler for the ST -- the latest version of Aladdin was compiled
with it.

Source record: 232949

You are right in saying that without additional hardware ATARI ST
cannot emulate a MAC. So, without a GCR controller board, one can
import MAC files either via 1.44MB disks or via serial line.
mc68010 is slightly better than mc68000 in that it can restart a
bus error cycle(access to non-existent address -- usually an I/O
address --, a bus error, subroutine call to an emulator, restart).
But if the I/O address or ROM address overlaps, mc68010 is not the
right chip and moreover MAC is now an mc68030 machine, which cannot
be emulated by machines lacking an MMU. Therefore, if I were you,
I should be waiting till ATARI TT with a MAC-II emulator on its VME board
will become affordable for poor people. The mc68030 is ideal for emulation
because it can cope with the address overlap (all the additional
hardware can have convenient addresses).

I do wish a SUN emulator for TT to appear soon.

>community, to kind of help me decide which route to go.

There are several choices though for the Apple // series. Proline gets
lots of raves it seems. GBBS "Pro" is nice, and you're not restricted to
using AppleSoft BASIC. (It's nice to get away from line numbers once in
awhile.) Its language (ACOS) is similar to BASIC, but is more structured.

METAL though is a rather new Apple BBS language, has lots of the features
of the ACOS language, but adds a lot more. I'm still catching up with the
documentation that came with the disks, and that by no means is the entire
manual. The packaged program Future Visions is nice, comes ready for
networking, and is easily editable by any text editor from Freewriter to
ProTERM to AppleWorks, and even editable ONLINE (as is ACOS). Its only
problem right now is that it is so new that it lacks some drivers, namely
printer drivers and support for some modems, like my DataLink 2400
internal. It has a lot going for it though, including some of the
features others have mentioned that Proline has. (Sorry guys, didn't know
it would run on a non-GS.) I believe you can also use ANSI with it, and
several other emulations.

3200. Macintosh emulators for sale

Newsgroup: comp.sys.atari.st
Date: 1991-04-20 00:29:38 UTC
From: stevela@beach.csulb.edu
Message-ID: <1991Apr20.002938.26505@beach.csulb.edu>
Source record: 232990

I have two Macintosh emulators (complete package) for sale:

1. Spectre 128
- Genuine Apple Macintosh 128K ROMs
- Spectre 128 Manual
- Spectre software version 2.65
- Transverter Manual
- Transverter software version 4.21
- and some other system disks in Spectre format to get you started

2. MagicSac+ and Translator-One device
- Genuine Apple Macintosh 64K ROMs
- Built-in clock chip on the cart
- MagicSac+ manual
- MagicSac+ software
- Translator-One device (allows ST drive to read Mac disks directly)
- Translator-One manual, all necessary cables
- and some other system disks in MagicSac format to get you started

I am asking $275 (including shipping) or best offer for the whole package.
Send me email if you are interested.

-Steve

>software . Advertising says that it is wunderful, efficient, fast, sure...
>
>But say, who believe advertising?
>
>So my questions:
>
>- Do ALL the software for Mackies function on the emulator?

Not all, but a large majority. Those having copyprotection rarely
work, because they try to directly look the floppy-controller.
Generally, programs that do direct hardware access, won't work
I have found very few of them.

>- how fast is it in comparison to a Mac LC or IIsi?

With basic ST/Mega, it is 20% faster than Mac Plus.
But with accelerator installed, you can even beat Mac IIfx...
Dunno about these models you asked.

>- How offen do the programs cras down?

Some can do it regularly... But normally a crash occurs quite seldom.
It depends what are you running. I have used Spectre without crash many
days without even resetting the machine. And Spectre can recover from quite
severe crashes too.

>_ What kind of hardware can you use with it (Portrait Screens CD, ...)

Almost any hardware, ST or Mac oriented. No Mac-screens can be used,
but there are quite many graphics-cards available for ST. And TT has enough
resolution without any cards.
You can even use AppleTalk and Mac SCSI with a special interface.
TT has it's own LAN, that works like AppleTalk with Spectre.

>I will compile the answer and make a posting of it

I've seen the ACER on an ST and I thought it was pretty bad; not even worth considering. You'd be better off with an Atari monochrome and color monitor. There are other multisyncs which are better. When I was looking for multisyncs, I compiled a bunch of info about them. You can find this info at atari.archive under the filename multsync.lzh. I have an NEC 3D, but there are other multisyncs which are comparible. There's certain guidelines the multisync must adhere to in order to work on the ST in all modes.

Check out HOSPITAL, AZT or AZTA, VKILL381 (Virus Killer 3.81). These are virus checker programs, each are a little different in their functions. I don't know about one that checks for general unauthorized access (other than for viruses), but there are ones that will lock out a user from accessing a drive. One is the shareware version of Quick Lock (which is now a part of the commercial Quick Tools) and there's also a desk accessory by Tim Purves I believe called Protector or something, which does the same as Quick Lock.

On a related note, I've heard that it's difficult or 'impossible' to get a virus on an ST hard disk, like the floppy boot sector type, because of the way the ST and hard drive communicate or something. Is this true?

Source record: 232859
Cross-posted to: rec.music.synth,comp.sys.atari.st

X-OR is NOT a multitasking tool with OMEGA as is CUBASE's MIDI MANAGER.

Although, OMEGA, I feel, is better then CUBASE. I've used both and
CUBASE is a lot buggier then OMEGA and very sluggish. It's like
working in jello. OMEGA is fast and direct.
The only way to utilize XOR and OMEGA is to have 2 ATARI's. I'm going to
try that soon.

> Who's going to do the distribution and if there will be an English Version
> then, who knows???

Many parts of the Turbo C system were written by a company named
"SoftDesign" in Munich. Their address can be found in some external
programs and the assembler.

BTW: Does anyone have experimented with the redirection vectors in the
MAS.TTP program? At the beginning of the program you find a "patch area"
where the integrated TC version writes down some vectors to input/output
functions for window i/o and access to loaded files etc. The result is that
the same MAS.TTP program is able to output both on a standard TOS screen
or in a window of the TC desktop.

You don't have to use the line numbers in BASIC when you edit your
Proline source. You can pickup MD-BASIC which gives you alot of the
power and comfort of a C compiler but it is actually a BASIC to
Applesoft translater. MD-Basic allows you to write your programs in
a text editor and then compile them into plain-jane Applesoft. You
can setup defines and includes in your source as well as call in libs
and such. It's the ONLY way to program for Applesoft. Also, you can
use a program like Program Writer which is basically a word-processor
for BASIC programs. Either way, it's simple, easy and powerful.

MD-Basic also comes with a decompiler so you can take plain BASIC
programs and decompile them into MD-Basic source with labels and
word-variables etc, etc.

>there a pd assembler for the ST? (I would like to have a dissassebler too..)
>
> [... Stuff deleted]

At atari.archive you can get Sozobon C or even better I
think GNU C. Both are PD or Shareware, but some PD-game
sources are yes fine to compile with GNU C. Both have
assembler, both have a 'make', both are shell versions,
both have a -O (optimize) option. But GNU C has an ANSI C
option.

As an editor you may use the vi or the GNU emacs.

Hope this helps

3219. Next TOS

Newsgroup: comp.sys.atari.st
Date: 1991-04-20 15:03:13 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Apr20.150313.8468@lsuc.on.ca>
Source record: 232869

If Atari is listening, I'd like to suggest that for the next version of TOS that they get rid of the "8.3" file name format restriction and move to "free form 12 character" names. This should maintain sufficient compatibility with MS-DOS disks because people who want to maintain this compatibility will simply use file names with this restriction, but it should allow those of us who are more Unix (and OS-9) oriented to bridge over on the application level more easily. Even Unix and OS-9 software that looks for final extension generally look for the last dot character, so that's not a serious problem, and those which work on prefixes will finally become practical.

What about OPUS? Version 2.2 (or is it 2.1 ?) is availabale at atari.archive.umich.edu in diretory atari/appications. It is very much usable (full GEM WIMP support) with excellent charting facility. If you register with the author (D.Harrison) he will send you V2.3 which supports full Lotus 123 file compability & it is by comparison extremely cheap.

Hello There:
Can some one tell me what is needed to run Whattahe demo? I tried both high
and medium resolution with my 4096STE and get 4 bombs in both case. Does that
mean it only run on ST?
Also the TCB demo file require some odd format to reload, where is that prog.?
Thanks
Tang

I am in the market for a hard drive and just got a catalog from tech-specialities in Houston Tx and was wondering if anyone has had any experience with them. I'm not really interested in buying a complete system from them, but am interested in buying a host adaptor and they are the only ones i've seen recently that are advertising them. Also, I know this has been asked before, but does anyone have any recommendations on which host adaptor to get? I'm looking at the ICD, but mainly becuase i had good luck with them when i had my 8-bit. All responses are welcome

You are, unfortunately, quite correct. I did speak to a representative that basically knew 2 things.

1. He was on a phone.

and,

2. It was a nice phone.

Other than that, v 3.0.5 was the last and final product released for MWC.

Mark Williams Company, however, is not dead - only the support for the Atari.

3228. Atari Color Monitors

Newsgroup: comp.sys.atari.st
Date: 1991-04-21 16:02:19 UTC
From: resst11@unix.cis.pitt.edu
Message-ID: <118243@unix.cis.pitt.edu>
Source record: 232883

I have a problem that I hope someone can help with. It seems that certain models of the color monitor, including the one I have, display colors much more darkly than they should. As an example, there are parts of Dungeon Master where I can barely see things even when I've got all the torches I can light on (and these same sections come out bright and clear on someone else's monitor.)
My questions (please Email answers, since I often don't have time to read through news): 1) can I adjust this thing so it will be brighter? and 2), if the answer is "no", does someone have a monitor I could get cheap that WOULD be brighter? I'd be willing to trade and then add bucks on top. The monitor FUNCTIONS fine, it just is darker than it ought to be; if you are mostly into word processing it wouldn't give you any problems at all.
Thanx,

Sea Wasp

>Thanks for the corrections! Something does not seem clear though; I can under-
>stand Sinclair naming their machines ZX 81 and Spectrum, but... Sam Coupe(?!)

This sounds like the 256k spectrum 'compatible' that Miles Gordon Technology
might even still be making.

>+The sinclair QL (the name is NOT Quantum QL) where fare ahead from
>+all other compters in it's days. Ok it was not as great succes! but there
>+is still about 100.000 users around the world.

8 years later!!! That's certainly not failure, even if only meagre success.
The OS design is beautiful and still being advanced today.

>640x400/480 graphics (4 colors)

Not so. The QL has 512*256 (4 colour) or 256*256 (8 colour + flashing).
68000 and 68020 (with optional FPU) 'compatibles' exist, and prototypes must
have been built with higher screen resolutions. The Thor XVI (was manufactured
in Denmark) has a 2-layer design with a seperate I/O processor to reduce CPU
load while communicating beyond the CPU bus. This gives a marked improvement
in throughput on such a multiprocessing environment.

>Some detractions of the QL are the marginal design (must be kept cool), non-
>standard keyboard, archaic tape drive and limited memory expansion. Support
>is hard to find in the U.S., and declining, so you get what you pay for it.

For D.I.Y. types:
There is a redesigned circuit board and kit/plans for a QL compatible,
available from QUANTA, a worldwide QL user group based in U.K. with membership
around 5,000 to 10,000 people.
The main improvements are a built-in floppy disk interface and a keyboard
interface to connect up standard PC-type keyboards, maybe also mouse and
parallel ports. As far as I know, the kit is available to members only.
The QUANTA newsletter is full of good quality material, also lots of special
offers to members. The QL is far from dead.

[exit QL mode before I get flamed]

>Maybe not TOS, but TAOS?

Good move! Let's see it, Atari.

3232. Help needed with TOS 1.4 and TDI's Modula-2

Newsgroup: comp.sys.atari.st
Date: 1991-04-21 19:29:06 UTC
From: n8742883@henson.cc.wwu.edu
Message-ID: <1991Apr21.192906.5170@henson.cc.wwu.edu>
Source record: 232886

I have found an apparent 'bug' with TDI's Modula-2 and TOS 1.4, and was wondering if anyone out there in net-land could give some advice.

I upgraded to TOS 1.4 last summer, and never did much Modula-2 programming as I did not have a need to. However, I am now taking an intensive programming class with Modula, and it would be very helpful if I could access the language at home.

I found out early that the ramdisk that comes with TDI's M-2 doesn't work very well with TOS 1.4-- after installing it, it crashes the computer (4 bombs) any time I switch disks in the A: drive and hit the escape key. I went around the problem by using a ramdisk in a desk accessory that I downloaded from atari.archive. So far so good.

After doing some programming and compiling, I had some errors in my file, which was saved by the compiler in a file with the extension ".ERM". The .ERM file contains a list of columns, rows, and error numbers where the errors have occurred. TDI's Modula-2 editor is _supposed_ to load up this file when editing the source code and show the errors on the screen, along with english descriptors.

Unfortunately, it doesn't. It loads up the file to be edited as per normal, but acts as if the .ERM file doesn't exist. This makes debugging very, very hard to do as I would have to get a hardcopy of the .ERM file, move the cursor around manually to the row/column coordiantes, and then look in a book to get a translation of the error number. On a practical level, this is too time consuming to be worthwhile-- especially with the large programming assignments I will soon be receiving.

I have copied the editor and compiler to the A: drive and recompiled my module to see if there was still a problem with the ram disk accessory, but have received the same results. I have disabled all accessories (except the ramdisk accessory), and all items in my AUTO folder to be sure there was nothing "clogging" up the editor.

Since TDI's ramdisk had a problem with TOS 1.4, I am assuming that the editor's problem is also with TOS 1.4. I am thus left with two options:

1) Get a patch/fix for this problem. Anyone have an idea/suggestion?

2) Reinstall my old TOS 1.0 chips. (GROAN!) I hate to do it, but the class is so programming intesive and my (working) Modula language is so much superior than what we have at my universitie's

mainframe that I would be willing to make the scarifice. If I have to do it, could anyone please mail me the schematics on which order to place in the chips? My chips are labelled as such: 7K2 A6, 6M4 A7, 6M3 A4, 7K3 B4, 6M3 6(B?) 6M3 A6.

Thanks a *lot* to anyone who can help me!

Perry Pederson

The problem with doing it in ProRebel form is that unkowingly you have
included the entire ProCopy program! The way ProRebel does it's magic is
it runs ProCopy and then when it reaches a certain point, it dumps all
the contents of memorY (including the program) to disk.

Source record: 232892

I also liked the new Atari User magazine. However, I'm not sure I'd recommend a subscription yet. This is intended as a free distribution magazine, so it should be available at no cost at your local Atari dealer. It is also being distributed through newsstands at $1.00 per issue, cheaper than the subscription price.

Also, while this first issue is well-written, informative, and timely, it is their first issue. I'd like to see if they can keep up the quality before sending off for a subscription. Especially since their is no price savings for subscribing. I imagine it will continue to be good, since it is put out by the same folks who published the excellent ST JOURNAL.

In short, if spending $15 bucks is no big deal to you, and you'd like to have the magazine mailed to you, go for it. Otherwise, try picking it up over the counter. You may find that you don't care for it, or may be able to pick it up for free.

> will be easier if I cam mimic this in gcc.
>

There is a standard filename called `PRN:' or `LST:' that you should be able to use just like any other filename. TOS recognises this filename and directs the output to the printer. For example, you would write fopen("LST:","w"). You'll need to check yourself which one works... one is standard TOS - the other was a Lattice special.

I've got a similar setup to you and I've got no problems when I run everything. Assuming you've checked the file with a texteditor and its ok, try loading Autogem before LGSELECT, and/or disabling all DA's.

I'll setup my system as you've described yours and see if I come across any trouble.

>X-OR is NOT a multitasking tool with OMEGA as is CUBASE's MIDI MANAGER.

Well, X-or is not a multitasking tool in itself, but it does run in KCS Omega's Multi Program Environment (MPE), which loads several programs into memory and lets you switch amoung them without re-loading (effectively a multitasking environment). In addition, MPE allows several of Dr.T's programs to share common data. For instance, you can play KCS Omega sequences from within X-or. The song editor in Omega will automatically load X-or performances when a new song is loaded, which will save lots of time. You can only do this sort of thing within MPE...you will lose all these capabilities if you go with CUBASE.

>Although, OMEGA, I feel, is better then CUBASE. I've used both and
>CUBASE is a lot buggier then OMEGA and very sluggish. It's like
>working in jello. OMEGA is fast and direct.

And I have yet to find a bug in KCS Omega.

> The only way to utilize XOR and OMEGA is to have 2 ATARI's. I'm going to
>try that soon.

Sorry, this is incorrect... although you will need at least two megs of RAM to fit them both, you can most definately run them in one ST...I can comfortably fit KCS, Tiger , the Song Editor and X-or in my un-modified Mega ST2, with Hotwire! and Maxifile resident. This is a very powerful setup, and it's great to switch amoung all of the programs with no waiting. I will have to upgrade to 4 megs in order to load T-Basic and Quickscore as well, though.

3245. The Atari SIG on the Freenet!

Newsgroup: comp.sys.atari.st
Date: 1991-04-22 14:00:16 UTC
From: aa400@cleveland.Freenet.Edu
Message-ID: <23767@know.pws.bull.com>
Source record: 232896

I thought all of you may be interested in logging on to the Cleveland Freenet. It has undergone some big changes in the past weeks, and I thought I would post a message written by one of the SIGops of the Atari SIG to usenet, so all of you could try it out. The Atari SIG is one of the largest on the system, it has several different message forums.

:

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.
Anyways, upon logging onto the Freenet one comes across the hundreds of Special Interest Groups on the Freenet ranging from a culinary and gaming SIGs to a Veterinarian, Dental, and Medical information dispensories. Another area is the Computer Corner which consists of many computer SIGs. The Atari SIG is one of the largest computer sigs here and is growing everyday.
Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.
The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.
The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!
Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists

range anywhere from phone numbers of Atari dealers and producers, to
software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software.
To sum it all up this area covers what's out there, who makes it, and how
to get it for all Atari products. The Special Applications Board is
just starting out. Currently there is an area for users of MIDI on the
ST. MIDI users are encouraged to use this as a means to discuss MIDI
related topics. This section is expected to expand in the future.
Accessing the Atari SIG has never been easier. One can access it
via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu"
or by calling (216) 368-3888 300/1200/2400 bps. Once on the system,
a user can apply for an account application and logon as a visitor.
Once here, simply type "Go Atari" to get to the Atari SIG. A visitor
can go anywhere on the Freenet and can read anything. They can't
post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

I assume that when you say Board you mean Newsgroup. Try
comp.sys.handhelds for information on the Portfolio. Not that there is
a lot of activity there, it is mostly HP48SX stuff (although the group
is in the process of splitting), but there is some. Also some Portfolio
stuff appears in comp.sys.laptops.

[Gobs of stuff deleted]

>On a related note, has anyone tried out Timework's new Data Manager
>Professional? Any thoughts you'd care to share? ^^^

Do you mean that there is a new version of Data Manager Professional?
I bought mine about a year ago, and although I haven't spent a great
deal of time with it, it does seem like a nice vanilla database.

The thing is completely GEM driven, but the menus and documentation
are very "British", and some of the terms were less than intuitive
in American English.

(Funny how the languages have diverged! Usually the changes I've
noticed are in developments in technology made since the turn of
the century...truck vs. lorry, trunk/hood vs. boot/bonnet and
so on. I was in England on business a year ago and had to
translate British English to American English for my partner.
Reminds me of a quote from "My Fair Lady". :^))

Once you get used to the terminology it is easy to use, and relatively
powerful. You have to live with the built in features though, because
there is no associated command language.

You also have to make sure you plan out your data fields well in
advance, because you can't easily add new ones or change parameters
of existing ones once you've gotten started. It should be
more than adequate for all but the most advanced users.

The program is not copy protected, so you can use it on your
hard disk. It comes on two floppy disks, and is not bad to
operate off of floppies (I did so before I bought my hard
drive).

>I use the ship program every time I shut down my computer

If the drive used in your MF60 is a Seagate ST277R, you don't need
the ship program anymore. The ST238R used in the Megafile 30 doesn't
autopark. You can find out the exact type of the drive used by
looking at the back of the Megafile 30 which should bear a label
with 'SEA6065' or something like that if it is a Seagate drive.

>
>I hope this reaches more than just me this time...
Sure did...

Your graphics board sounds quite good, even for twice the price, but
what H.Chu and I were talking about was some sort of graphip coprocessor
like the old 8-Bit ANTIC. ANTIC provided control over the vertical
arrangement of the screen (where to get the memory from and to display
in what resolution). I figured that a coprocessor that also tried to
control the horizontal arrangement (as great as that would be) would be
much to costly in terms of bus speed. Otherwise you'd need to
restrict the number of windows displayable pretty severely.

As to the guy, who responded saying that hardware cursors were bullshit
in the nineties. We 'discussed' this offline and I just want to state
that
a) I am not convinced that hardware cursors are useless
b) questioning my CS knowledge was maybe a bit hasty

Anyway. I have seen a couple of adds now in various journals about note
book computers. I thought that the Atari notebook was doing handwriting
recognition, or am I wrong on that ? Most of the other notebooks don't
seem to be able to do that.

3252. Harddisk high level format software

Newsgroup: comp.sys.atari.st
Date: 1991-04-22 16:39:57 UTC
From: remco@gem.stack.urc.tue.nl
Message-ID: <184@gem.stack.urc.tue.nl>
Source record: 232901

Has anybody out there software to format a harddisk for the
atari-st? The harddisk is connected with a C'T-harddisk interface.
(C'T is the fine german magazine that had an article about connecting
a harddisk to the st with a simple XT-interface card)

The harddisk is connected to the DMA-port via an interface and a
OMTI5527 controller. The harddisk is a Seagate ST238R (30 Mb).

The harddisk is already low-level formatted with the software from
the C'T magazine, but there is no high-level format software on that
disk. Who has build the same interface or has software to do the
high-level format?

P.S.: Please respond by news (first).

Remco Leliveld.

From: M.A.Rahin@lut.ac.uk
Message-ID: <1991Apr22.170659.28977@lut.ac.uk>
Source record: 232910

Many recently, once again showed their frustration for not being able to draw fancy charts with the OPUS program. All this is mainly due to OPUS's rather strict rule on printer font selection. The main requirement is that one must use the exact corresponding printer font as for the screen font. If this requirement is satisfied, one is more or less assured of hassle free operation. There is one other thing one must do, i.e., run FONTWIDT.PRG in order to set up font metrics for OPUS's internal use. Any way, here is my ASSIGN.SYS file. It works perfectly OK with me and hopefully will work for you as well.
[I'm using a mono screen and a 24-pin Epson LQ800 compatible printer.]

```
----------------------- Sample ASSIGN.SYS File -------------------------

3255. LIFE3.LZH

Newsgroup: comp.sys.atari.st
Date: 1991-04-22 17:22:43 UTC
From: pyr579@oz.plymouth.edu
Message-ID: <1991Apr22.172243.16780@oz.plymouth.edu>
Source record: 232903

Hello,

I just got a hold of LIFE3.LZH from atari.archive and was immediately impressed by the editing allowed in the universe. It is easy to use, the left button creates a cell, the right kill a cell. But when I went to load pre-created universes which were lzhed within the LIFE3.LZH, the program responded that the files were too small to be universe files, WHAT? These were included as universes. Then I tried to load pre-created patterns such as glider-guns and chesire cat (the classics) and they also didn't work. The program claimed to be loading them but nothing was displayed. There is a feature in the menu to show pattern file information. I check out chesire cat with this, and it claimed the file to be in ABSOLUTE format. I went out to GEM and checked it, it was in PICTURE format. This program has a lot of problems, you can't do half the stuff it says it can do. Who ever wrote it, you have a good idea but an obviously lacking implementation, if it were fixed it would be an excellent version of LIFE, but as it stands, it isn't too impressive.

Stephan

I have a great mono demo from Germany, called stdemo.tos (I think). Anyway,
it is a tos file. I believe I got it from atari.archive. If you cannot
find it there, email me and I will upload it (this one is a must have). I
would not consider getting a color monitor "upgrading", unless you are
keeping your mono (the best of both worlds). I used to only have a color,
and it was hell on my eyes for any kind of real work.

They are the lastest versions, as far as I know. There was only one version of AZT and HOSPITAL, and many versions of Virus Killer, but 3.81 is the latest. And yes, they are at atari.archive.

3258. Uploading to atari.archive & comp.{binaries,sources}.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-04-22 19:26:14 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Apr22.192614.29416@terminator.cc.umich.edu>
Source record: 232907

Uploading to Atari.archive.umich.edu
and
Posting to comp.{binaries,sources}.atari.st
By Jeff Weiner, Atari.archive Guardian

How to upload to atari.archive.umich.edu:

There are two main ways to upload to the archive: FTP or mail

1: FTP - This is the preferred method, as it doesn't clog my mailbox with
megs and megs of stuff, not to mention it's a bit easier for you too.
Logon to the archive as usual, then issue the following commands

```
cd ~atari/new
type binary
put filename.ext
mail weiner@atari.archive.umich.edu .... "Hey Jeff, I just uploaded this..."
```

This last step is very important. As we're now integrating the
index with text and the ls -lR listing, descriptions and an address to
send questions to are key.

Ed Krimen, ekrimen@ecst.csuchico.edu, adds this:

For those that may not know, may I add that, for aesthetic effects,
if you enter "hash," before you "put filename.ext" or "get
filename.ext," the ftp program will display a # for every 1024 bytes
sent or received. Actually, when you 'put' a file, it will display
bunch of # at once. Moreover, if you enter "bell," it will sound your
system bell when a function has completed. Finally, you can send and
receive a list of files using the "mput" and "mget" commands,
respectively, with a list of the files after the command.

2: MAIL - This is a bit slower for you and for me, but is still very effective.
Simply uuencode the file, (please split it into parts ~=40 M or less please)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpfull as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled file transmission, containing a short description of
the file, etc. Shar files are also acceptable, but I prefer the uuencoded.

And for those of you who would like to see your binaries and sources appear
in comp.{binaries,sources}.atari.st, the following is taken from Steve
Grimm's Introduction to Binaries and Sources:

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator, Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist, atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and forward them to me. Submitting to him saves net bandwidth, so it's encouraged.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while.

Also, as of volume 8, I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this pretty much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to sun!ebay!panarthea!atari-sources. In Europe, send your submissions to Jan-Hinrich Fessel, the European submoderator of the group, at unido!atari-sources (or, if you're a masochist, atari-sources@unido.informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it

for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas' "uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

3259. FTP Beginner's Guide

Newsgroup: comp.sys.atari.st
Date: 1991-04-22 19:28:49 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Apr22.192849.29516@terminator.cc.umich.edu>
Source record: 232908

This is a basic guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

~~~~~~
Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.
Also, if your machine doesn't allow you to specify the atari.archive name,
try using out internet address : 141.211.164.8 Then, march down to
your sys-admins office and ask him to install name-service. Your life will
become much easier.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
ls -C : Lists the files horizontally, instead of vertically.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
cd .. : Goes 'back up' a directory, to the one you came from.

These are about all you need to get moving around the archive.
~~~~~~

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer files. More often than not, you'll want to transfer the files from the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that you'll be transferring a binary file. This is really important. You'll waste a LOT of time if you download files that were not transferred in binary mode.
Third, issue this command 'get <filename.ext>'. This will instruct the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This tells our machine you're no longer interested in ftping files, and would like to go back to your command prompt.

Now, you'll need to download your files from your mainframe(sparc, whatever) to your ST. Usually you'll want to use either kermit or x- or y- or z-modem protocals. They're very reliable. I'd be quite hesitant to try something else. Also, your machine and ST are usually unique to you. This means that I really can't help you with this part. You could try asking, but I'm going to promise anything.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of. Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours, in our time zone. That would be 9 am to 5 pm , EST. This roughly means upload or download one file or so and little else during these hours. After 5pm, have a blast. Go nuts. We probably won't mind nearly as much..... Otherwise, we will drive to your campus or place of work (even if you live in Europe) and we'll kick youe butt. Or, Jon will sing Prince songs to you. Whichever you'd like the least.

2) If you have a question about some aspect of ftp service or some other area of your computer, please ask around at your site first. Don't immediately fire off all of your questions to us. I don't mind answering questions about the archive, problems with logging in, or something similar. But I tend to get upset when people ask me questions like, "Jeff, how come I can't get the fgrep command to work properly on my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I know it's not the greatest thing to do, but if you can find time to download stuff, I think you can find time to return the favor and upload things also.

If you have any reasonable questions, any comments or concerns, etc. please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

Hello Netland,
My friend just gave me a ST-251 hard disk. I have no cables
for it, no controller, no power supply, or case. Could someone
please tell me what type of controller, power supply and the
other things needed to attach this thing to my ST. It will
be my first Hard disk on my ST. Also can you provide the
name and phone number of a supplier so I can purchase the
equipment I need. I have a 1040ST with TOS 1.2. I will also
need to get some software so I can format and control the thing.
I know stuff like this has been posted before but I skipped it
because I couldn't afford a hard disk. Please e-mail me
or post the information. Thanks in advance!!!!!

Greg.

3263. Ghostscript source and binaries uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-04-22 22:05:30 UTC
From: timothyg@ncsa.uiuc.edu
Message-ID: <1991Apr22.220530.18559@ux1.cso.uiuc.edu>
Source record: 232918

Hi,

I posted this message once, but it didn't seem to make it. Try two ...

Sources and binaries for ghostscript have been uploaded to atari.archive (141.211.164.8). No screen support yet. DeskJet, LaserJet, and Epson printers are supported, but only the DeskJet has been tested to any extent. The file names are gsbin.zoo and gssrc.zoo. I expect that they will show up in the gnustuff directory.

A warning about compiling sources is in order. I recompiled a couple of source modules with different versions of the GNU libraries (I think they are newer than the ones I have been using), and the deskjet driver ceased to work properly. This is disturbing, but I don't have time to track down the problem now. Maybe someone else will figure it out.

>UUCP: crash!pro-odyssey!chuckie
>ARPA: crash!pro-odyssey!chuckie@nosc.mil

QuickTOS is real and p/d. I wrote it and uploaded it to various bulletin
boards about a year ago. The purpose of Quick TOS is to run disk based
versions of TOS, such as TOS 1.0 or TOS 1.4, from a hard disk so that you
save yourself the 30 seconds or so required to boot TOS from floppy. You
can go from say, TOS 1.6 on a 1040STE to TOS 1.0 in about 3 or 4 seconds.

It has nothing to do with pirating TOS (i.e. dumping your TOS roms to disk).
and QuickTOS will not support such pirated versions of TOS. Shame on you.

TOS only floppy is available from Atari dealers and maybe still from Atari.
A TOS disk also came supplied with all early 520 STs.

>the monochrome mode).

Is that 4096 colors on the screen at one time, or is 4096 the numbers of colors that one gets to choose a subset of, like 16 out of 512. Also, how much does this baby cost? I might consider getting one some day, and a rough price would tell me how long I have to wait. Thanks.

Someone posted this a while ago.

Here is a simple patch to enable 'whattahech' to run on the STe:

After you have extracted the MSA file on a disk you start your fave
disk editor and write the following in the bootsector :

Address Value
206(dec) 2e 3c 00 00 3a bc
510(dec) d2 52

that it...
(some of the demos with overscan work, and some don't (they flicker a bit))

Then, if I wanted to change the values back, I added:

The original settings are

E0 8B EA 8B B7 47
B8 ED

I'm fairly certain that the version at atari.archive has this
modification already performed. It also works on the ST, BTW.

>with starfields and rainbows and geometric shapes in neon colours and similar
>bizarre decorations.

I always wanted to paint mine black too (I think I'll pass on the stars and rainbows though) but you'd have to watch that the paint didn't flake off at a later date and make your ST look really bad. I imagine some sort of thick car body laquer is in order to avoid the flaking. What do Atari do when you send in a painted ST for repair? Send back a vanilla grey one I guess.

BTW: If you are going to call anyone a GOD of arcade games then surely the Bitmap Brothers deserve to be called that more than Jeff Minter does. Not only that but when it comes to documentation, Jeff couldn't write a manual to save his life. The Trip-A-Tron manual was written by Jeff, for Jeff, and was totally useless. Not only that but he spent a lot of time, and ST memory, on those stupid colourful menu/consoles each with it's own unique exit box.

|>strict rule on printer font selection. The main requirement is that one must
|>use the exact corresponding printer font as for the screen font. If this
|>requirement is satisfied, one is more or less assured of hassle free
|>operation. There is one other thing one must do, i.e., run FONTWIDT.PRG in
|>order to set up font metrics for OPUS's internal use. Any way, here is my
|>ASSIGN.SYS file. It works perfectly OK with me and hopefully will work
for you
|>as well.
|>[I'm using a mono screen and a 24-pin Epson LQ800 compatible printer.]
|>

Another problem is that the fonts _must_ be in the same order for every
device in the list.

If you do not have a printer font for a screen font that you are using
you can simply use the screen font as a printer font but I wouldn't use
it in opus or the printed output will be minute. For example when
running gemini, you may wan't to have the gemini font for the console
window and this font has no printer version.

3274. VT220 - 8 bit Terminal Emulator Required

Newsgroup: comp.sys.atari.st
Date: 1991-04-23 10:14:41 UTC
From: lezo@syma.sussex.ac.uk
Message-ID: <4894@syma.sussex.ac.uk>
Source record: 232928

I am searching for a VT220 terminal emulator which can handle VT200 -
8-bit cursor and numeric keypad ESCape Sequences. For example it should
be able to send the following cursor control sequences in Application
mode:

Application Up 8F A 8F (hex) = 143 (dec)
Down 8F B
Right 8F C
Left 8F D
Can anyone help?

Ideally I would have liked to have used Uniterm but my reading of the
manual (see Page 26 (para 6.3.2) 'C0/C1 modes') would seem to imply that
only VT200-7bit cursor keys can be sent by the cursor and keypad keys and
that you can not send VT200-8bit sequences. Furthermore, I don't think
you can re-program the unshifted cursor keys.

So if you know of a good VT220 emulator which can satisfy my purposes or
indeed if you know how to reprogram Uniterm to achieve the same effect
please let me know.

Many thanks.

3275. Re: atari user mag

Newsgroup: comp.sys.atari.st
Date: 1991-04-23 10:23:34 UTC
From: scale@abode.wciu.edu
Message-ID: <1991Apr23.102334.3789@abode.wciu.edu>
Source record: 232927

Hi Matthew,
Actually you are correct, AtariUser is intended as a free
magazine for the users. It was also intended for the dealers (both computer
and bookstores) to give it away for free; but a few dealers and several
bookstores said they would not carry it if AtariUser was a free magazine
(that's why AtariUser has a $1 cover price, so those that insist on charging
for it can).
The $15 price is actually an "introductory price" available for this
month only. The annual subscription rates will be:

$ 21.30 US Bulkrate
$ 41.30 US First Class

This subscription prices are set according to the cost of postage.
AtariUser is offering subscriptions not for profit; but for users who cannot
pickup AtariUser in the user's local area.
In addition to computer dealers and bookstores, AtariUser will also
be available free to/from local user groups.
AtariUser's future looks very promising with John Nagy (of Z*Net) as
the Editor-In-Chief. The AtariUser staff feels that the first issue had few
mistakes, and the quality will only continue to get better. Bye.....

Mine was added to an old 520ST (w/2.5M). I can't speak for the installation
into a Mega, but in a 520 there doesn't seem to be a heat problem. I run my
ST for about 8 hours a day (as a terminal).

I have a question about ST word processors. I would like to know what is considered the easiest *GEM* word processor to use. I am thinking that it has to have easy mouse-based point-and-click cursor location, cut, paste, delete, and move operations. I don't need a document processor or a desktop publisher, just something easy to learn and use. Send me e-mail and I will summarize for anyone else who wants to know.

Mark Williams company is still operating (MUCH MUCH more successfully than ever). They seem less inclined to do anything for the ST as time goes on, but their commitment to continue supporting the products they've already sold seems firm. Their present flagship product is the COHERENT operating system for PCs (a small, modular UNIX-alike).

I got some particulars mixed up in a previous message (now cancelled). They've changed phone numbers again, and I think they've moved, but they're still in the suburbs, not back in Chicago. Anyway, if you call the main number (708)291-6700 and say you need support for their C compiler for the Atari ST, you should do alright. What you get is going to be essentially whatever a bright guy who hasn't used the ST C compiler lately (or perhaps ever) can give you with online access to the source code and the problem reports/fixes database. That's enough for most stuff that'll come up.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I wouldn't have believed it a year ago when I bought it, but I now have to expand the memory on my Mega ST2. Those MIDI programs and essential utilities really eat up the memory! I would appreciate advice or pointers to references on the following topics:

1. Impressions of the Z*RAM Mega 2-to-4 board. Specifically, how reliable is it, and will the board get in the way of the expansion slots or an internal hard drive? Also, how likely is a solderless board to shake loose?

2. Companies that will install a memory upgrade by mail: experiences, reliability, cost, turnaround time and so forth.

3. Articles or instructions for a DIY memory upgrade. Listings of chips (with part numbers) and good sources for parts would be great. I know how to use a soldering pen, but it's been a while, so advice on how tricky the job is would also be useful.

4. In the "as long as I've got the hood up" department, I'd like to know how people who've upgraded from TOS V1.2 to V1.4 have fared. Was it more trouble than it was worth? Did you lose any program compatibility? Should I just hang around until the fabled STE Mega upgrade board comes along?

5. Is there a list of boards that make use of the Mega expansion slot?

6. Has anyone had experiences installing an internal hard drive in a Mega?

Of course there is always the option of unloading my Mega 2 and upgrading to a Mega STE...

Thoughts, opinions, dirty limericks welcome.

From: pyr579@oz.plymouth.edu
Message-ID: <1991Apr23.180315.20927@oz.plymouth.edu>
Source record: 232932

Hello,

I have a large number of floppies sitting around here and don't
really want to label them over. I would rather use some sort of disk catalog
system which could pull the directory of a disk into a text editor at which
point I could put comments beside each file. I could then print it and keep
all the filenames in a notebook. Anyone ever seen anything of this sort? I'm
tempted to write one from lack of success in searching, but I basically
program in Turbo Pascal on IBM's and have no prg lang for the ST so I thought
I make a final call for this type of software.

3284. TEAC 2.88MB SCSI floppy

Newsgroup: comp.sys.atari.st
Date: 1991-04-23 20:18:25 UTC
From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <12616@uhccux.uhcc.Hawaii.Edu>
Source record: 232947

There is discussion in comp.sys.nsc32k about using a SCSI floppy with their systems and they are considering a group purchase. I was wondering if this newsgroup is interested with using a 2.88 MB SCSI floppy with their Atari ST systems.

This information was obtained from TEAC America [(213) 726-0303]: there was a new standard implemented late last year (~Nov. '90) for 4MB ED disks, so that a disk density indicator hole would specify to a 2.88MB drive whether the inserted disk was of 2.88/1.44/720 formats. This new standard resulted in a new model 2.88MB drive. TEAC's model number for the drive implementing the change in optical sensor and firmware is FD-235JS-501-U. This differentiates it from the old standard drive which has model number FD-235JS-401-U.

There is a programming manual for the drive and it is part number FC1-01 Software. Contact Ken Rivera at TEAC (extension 654) to order the manual.

The 2.88MB drive has these specs: 2 heads, 80 cylinders, 36 sector/track, 300 rpm rotation, 135 tracks/inch, 90 KB/s formatted transfer rate (four times faster than 720K drives). The drive is downward compatible with 1.44MB/720KB disks.

The suggested list price for the TEAC 2.88MB SCSI floppy is $285 and for their 1.44MB SCSI floppy, $230.

Two distributors for the TEAC drive are in California:

Western Micro (619) 453-8430
J.D. Hannam (714) 632-3458

Some benefits for Atari ST/TT owners would be four times storage and speed, without modifying your floppy controller. It would also be fun to inexpensively experiment with SCSI.

The drawbacks are that a special driver has to be written for the drive and a SCSI adaptor is required.

This info is posted to gauge how many people would be interested in either the 2.88 or 1.44MB SCSI floppy. If emailing a reply to me, please specify these things:
a) prefer 2.88MB or 1.44MB SCSI floppy
b) max. price you would pay for either drive
c) willing to write a driver to interface it with the Atari ST/TT
d) willing to handle a group purchase [others may pay a handling fee]
person should be in the Southern California area.
e) any comments [this is bad idea, other preferred brands, etc.]

I'll post a summary in about 7-10 days.

Thanks,
Jack

>backing storage :->

[I posted this earlier, but from the look of it the message didn't leave my
site.]

It's not the least bit wierd if you work through the logic of the busses.
The fatal flaw in your reasoning is that you think since both drives are
SCSI drives, they should have different SCSI unit numbers. What's actually
happening as far as the TT is concerned is that you have one SCSI drive and
one ACSI drive. The Supra drive is connected through a controller which
lets you plug the SCSI drive into the ACSI bus. The controller, in
essence, creates a tiny SCSI bus between it and the drive you connect to
it. This controller will only control one unit, and it has to be SCSI unit
0. The controller probably has a switch of its own, to tell it which ACSI
drive it should respond as.

If you add another Supra controller (or ICD controller or any SCSI-to-ACSI converter) to the ACSI bus, you would have to make it ACSI unit 1, but the drive it controls would still be SCSI unit 0, and there's no conflict because it's the only SCSI drive on the SCSI bus that the controller creates between itself and that drive.

Get the picture?

More minutae: HDX asks "SCSI or ACSI" when you select a drive; it's talking about SCSI or ACSI as the TT sees things, not necessarily which kind of mechanism it is. Almost all Atari drives are now SCSI drives with an ACSI-to-SCSI converter inside the case, where you don't see it. The Megafile 44 is a good example. Some used to be (and may still be) ST-506 drives with an ST506-to-ACSI converter inside the case, so don't count on one or the other without checking.

The chief difference between SCSI and ACSI in the TT is that the SCSI bus supports the full SCSI command set, and ACSI doesn't. One important command which ACSI does not support is "inquire capacity." When you can do "inquire capacity" you don't need to know anything else about the drive to format or partition it, ergo no wincap and no "click on the drive type" box. Wincap is still required for HDX to be able to format and partition some (all?) ACSI drives.

A final note: Mega STe's have an internal SCSI drive like TT's, but again, there is a SCSI-to-ACSI converter inside the box, so as far as TOS and HDX are concerned, it's an ACSI drive. Mega STe's don't really have SCSI, even though it kind of looks like they do.

Mine did this too...

Inside there are many different adjustment screws in different places.
Many are evasive, even to find! One in particular is a brightness adj.,
which is different than the one you can get at externally.

I adjusted my monitor a few months ago, and ended up making it a little
TOO bright, but I haven't cared enough to fix it...

I used an insulated non-metalic 16" screwdriver, wearing a lead bodysuit,
and stood a mile away as I made the adjustments... plus I closed my eyes!

If you screw up the monitor or yourself, don't blame me.

Hi Terry,
Correct, the ISAC will display 16 colors from a palette of
4096. The ISAC board costs the same as the Moniterm board; $800 MSRP, but
actual street pricing is around $600 to $650. It has been available for
quite a while now. I believe Jay Craswell (designer/programmer of the ISAC)
recently updated the drivers with a new version. The Calamus Series, DynaCADD,
PageStream and several other applications have specific support for the ISAC.
So does CodeHead's HotWire and MaxiFile (awesome piece of coding!) 3.0's, and
thier shareware utilities. Bye.....

In my opinion, to post these ZNet issues to the net is an abuse of the net. Regardless of the outcome of your informal poll, such postings should not be done. These articles are available to anyone who wants them to be mailed to them, and they are available at a well known archive site, eiter by e-mail order or by anonymous ftp.

Jon_Clark, please cease and decist.

>Interesting, how did the purchaser manage to get money to you? I understood
>that it's remarkably expensive in the USA to receive non-US-Dollar money from
>abroad. Could I have sent you a cheque drawn on a British bank?

Come on, this is not a problem in most cases. I frequently buy items from the US, and I suspect that the Canadian situation is not unique. We can buy money orders in US dollars from the Post Office or from most banks, and I can write cheques in US dollars on my regular bank account by simply writing US$ all over the cheque (this latter feature may not be as common).

I don't think that there is any problem coming up with paper in US funds that a bank will accept, but S&L's are another matter. I tried to give my brother in the US $200 during a recent visit, and his S&L wouldn't even accept AmEx traveller's cheques in US dollars sold by a Canadian bank. So I went down the street and got the money on my bank card. But real banks (the kind that stay sovent for weeks on end) have never been a problem.

3293. Atari Questions...

Newsgroup: comp.sys.atari.st
Date: 1991-04-23 23:17:14 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1991Apr23.191714.9275@umiami.ir.miami.edu>
Source record: 232764

I have three questions regarding Atari's recent machine releases...

1. Why is the TT being shipped with the old MEGA keybooard?

2. Why is the MEGA/STE being shiped with the old MEGA Keyboard?

3. Becasue the old keyboards are being shipped in these machines, does it
mean that I can upgrade my keyboard to the newer version???

Just wondering...

Mark Santora

3294. Info on Ultimate Ripper

Newsgroup: comp.sys.atari.st
Date: 1991-04-23 23:38:09 UTC
From: carl@tharr.UUCP
Message-ID: <2094@tharr.UUCP>
Source record: 232944

Has anybody used the "Ultimate Ripper" cartridge for the Atari ST? I have
been told that it will break into any program (is this possible?) but
have yet to see it reviewed in any of the magazines in this country...

Is it likely to be worth spending my money on? Does anyone have any more
information?

thanks in advance.

carl.

As it turned out, he sent me a check drawn on an international bank
which I sent off to
the World Trade Center in New York to cash. It did cost him an extra
$10 to cash, but
he wanted the Ditto II bad enough that it became worth it.

> ++ > It's not too much to ask is it ... ?
>

As I sit here testing things on my MEGA STE I discover two things:

a) PINHEAD won't work on TOS 2.05
b) SYSMON won't work on TOS 2.05

Does any body know if there are (or will be) new versions out soon that
supports TOS 1.6, TOS 2.05 and TOS 3.05 ?

Do NOT buy from tech-specialities. Their products are substandard and
they do not support their stuff. I bought these so-called CPU cases
from them and they were the worst pieces of junk I've ever seen.

>but am interested in buying a host adaptor and they are the only ones i've
>seen recently that are advertising them. Also, I know this has been asked

>I'm looking at the ICD, but mainly becuase i had good luck with them
^^^
ICD is a GREAT company. If you are looking for a Host Adapter try
buying from Toad Computers or D&P computers, they are both reputable
companies and they won't dick you around.

Well, since I am required to have printer fonts to run OPUS with its charts: does anyone know of any PD printer fonts for an old Epson FX-80? Of course, I would need the matching GEM screen fonts! I do have the PD Atari Times Roman (ATR) screen fonts.

If only OPUS would *not* require printer fonts...! Sigh.

Message-ID: <1991Apr24.094735.19857@dcs.glasgow.ac.uk>
Source record: 232819

Help me, please!

I am converting all my C listings from Laser C to Sozobon C, and I have encountered a major problem - I can't make GEM programs any more!

The problem is this - I have changed the INCLUDE statement to include the GEMFAST.H header file, compiling the source produces errors. The compiler says it does not know about statements such as :

appl_init
v_clswrk...etc...

Everything works fine if I use Laser C, surely it should work with little modification on Sozobon C.

Anybody out there got any suggestions?

>You are right in saying that without additional hardware ATARI ST
>cannot emulate a MAC.

Actually, there are several pirate versions of the Spectre, which load the mac OS from a disk image. Dave Small goes to a lot of trouble to make this difficult, but unfortunetely there are those that spend the time to do it anyway. These pirate versions are totally disk based, requiring no hardware whatsoever. Of course, hardware is needed to emulate the group coded record disk format that the mac's use (hence GCR).

Well, if the TOS 2.0 file is a PIRATE file, then any TOS 1.4 file would also
be a PIRATE file, right? That means that the Internet is the WRONG place
to ask for it, right?

Don't be a shithead, Chuck. The benifits of TOS 1.4 have been well discussed
both here and in most ST publications. If you have a hard disk, you probably
want it. If not, spend your $80 on blank disks.

>0.

My reasoning is fine, thank you. Yes, what you describe above is intuitively obvious after knowing that both drives needed to be set to 0. What is less obvious is why the Supra HAD to be set to 0. My ICD host adaptor will allow me to set the SCSI device id to whatever I want, and will still find the drive at boot time. I can hook multiple drives up to it, etc. Thus, I make the following assertion: there are two logically seperate busses on the TT (which concern fixed disks): a pure SCSI and an ASCI. Each is independent in the sense of SCSI device id numbers, so each can have a device 0 without conflict. My question (based on this assertion) is this: Why did the Supra drive _require_ SCSI id 0? It was the only device on that "bus"? In other words, do the SCSI id numbers on a bus have to start with 0, then increment by one? Could I have a device 0, then a device 4? If not, why? This has been successfully done by both Supra and ICD (and Atari, I thought). If so, then is the restriction only on the first SCSI device (ie does a device 0 have to exist, but other devices need not be sequentially numbered)?

Another way to look at the question is this: What need be considered when hooking up multiple ASCI devices (consisting of host adaptor and SCSI device) to the TT? How must the SCSI id numbers be picked for all drives to work? It is inexcusable that this information was not included in the TT manual. For example, my hard disk was set to SCSI id 1 when I bought it. Thus, were I to get a TT (and without the benifit of helping my friend) I would not be able to get the damn thing to work without a phone call to Atari. Since this computer is a logical upgrade from the ST architecture, all information needed to "upgrade" should be included in the manual!!!!!!

Hmmm, the TT I saw yesterday had a new keyboard, with rectangular function keys. Are you sure you saw one with the old Mega keyboard? Personally, I think the Mega keyboard is nicer, as the new TT one I played with had a "bubble switch" feel to it, similar to extremely cheap PC keyboards.

Date: 1991-04-24 12:42:20 UTC
From: rsl@aplpy.jhuapl.edu
Message-ID: <1991Apr24.124220.23028@aplcen.apl.jhu.edu>
Source record: 232757

Tried to email, but it bounced.

I have been using WordWriter ST by Timeworks for about 2 years, and think it is very easy to learn. It has most of the functionality you could want from a basic wp, and it did not cost me much (on sale, $49).

3320. KAOS TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1991-04-24 13:20:22 UTC
From: ersys!ggranger@nro.cs.athabascau.ca
Message-ID: <NkTw11w164w@ersys.uucp>
Source record: 232774
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

If anybody in Europe has the KAOS TOS 1.4 fix files, it would be greatly appreciated if they could upload them to atari.archive.umich.edu. Talk has been buzzing across the pond here in North America about KAOS TOS (in the FoReM & ///Turbo x-nets), and many people would like to get these fix files for TOS 1.4.

BTW, what kind of bugs were fixed in KAOS TOS 1.4 that makes it so much better than the regular TOS 1.4?

3321. Atari.archive Monthly Posting

Newsgroup: comp.sys.atari.st
Date: 1991-04-24 13:44:49 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Apr24.134449.6088@terminator.cc.umich.edu>
Source record: 232777

Welcome to atari.archive.umich.edu

This is the monthly posting from the umich atari posse. We hope
it will answer some of those nagging questions that always seem to pop up
from time to time. If you have any additional suggestions, please mail
them to me, at weiner@atari.archive.umich.edu.

1: How do I use BART?
Now that BART is back on-line again, you can get bart help by mailing
atari@atari.archive.umich.edu and include the word 'help' in the body of
the message. This doesn't mean you have to send mail Jon or I.

2: How can I connect via FTP?
If you are interested in ftp, I recently wrote a beginner's guide. Please
mail me and I will send you a copy. I'll post it every once in a while too.

3: What if my machine doesn't support name service?
Two things to do here:1) Demand that your sys-admin install it soon,
and 2) use the internet address 141.211.164.8

4: I can't download because my hard drive doesn't work and my modem goes
out sometimes and .....HELP!!!
Sorry, outside of the archive I really can't help you....Your best bet is
to find someone at your site with a similar set-up, or post to c.s.a.st
for advice.

5: HEY! Your index is much better than it used to be!!!
HEY! I know! We've added text descriptions and a whole lot more! To top
that off, the index will now be updated instantaneously. No more waiting
for me to get off my butt and do it.... If you have noticed any errors,
or have any suggestions or descriptions of files
please mail them to me!!

6: When I try to FTP to the archive's host, I get a message saying that my
machine wasn't recognized and I wasn't allowed to log in. What's up?
We only accept ftp logins from recognized hosts. If you are not allowed
to log in, please try again. It is possible that the DNS took a bit too
long. If you are still denied access, ask your sys-admin to fix your
name servers.

7: Ok, the index is better, but I can't find a thing in ~atari/utilities.
What's up there?
I'm in the process of reorganizing this directory. It just got a
bit too big and out of control to be really useful. I should be done
with it by the end of the century.

8: Here's a question for you Jeff, how come I can't use 'ftp terminator.cc.etc'
any more to connect?
That's because you're not using atari.archive.umich.edu like we told you
to. In the near future, terminator.cc.umich.edu will change it's name.
Don't say we didn't warn you.......

There are a few files you'll really like to have:

archivers/arc602.arc : The latest version of arc
archivers/zoo.arc : The classic archive program
archivers/compress.zoo : Useful for removing .Z from sounds and binaries
archivers/unlzh11.arc : Unpacks .lzh files
archivers/sttar.arc : Removes those nasty .tar extenders
THEY ARE CONTAINED IN THE SELF EXTRACTING ARCHIVE starter.tos!!! PLEASE USE IT!

Thanks to everyone who has uploaded anything lately.....

Two things to note this month:
1) We just got a whole bunch of new gnustuff from Jwahar Bammi.
Speed Reader from the Great Space Coaster says, "Check it out!"

2) Scott Wood, our man with the portfolio, says, "YES! We are accepting
portfolio uploads. YES! I have spent tons of cash trying to get
stuff from GEnie." Please upload some stuff, portfolio users, and
then drop Scoot a line at swood@atari.archive.umich.edu

BART PROBLEMS:
Common Error for the month of April: BE SURE TO CHECK YOUR SPELLING!!!

The Umich Atari Posse says, " See you all in Windsor on May 4-5"

PLEASE NOTE: FTP service is a privelege, not a right! Please make
a supreme effort to keep heavy FTP use in off-time hours (i.e. after
5 pm EST but before 8 am EST).

Any ideas, questions, comments, etc. to me,
weiner@atari.archive.umich.edu

3322. Corona LP300 lasar printer

Newsgroup: comp.sys.atari.st
Date: 1991-04-24 14:51:13 UTC
From: aking@bbn.com
Message-ID: <63863@bbn.BBN.COM>
Source record: 232776

I've inherited a Corona Data Systems LP300 (lbp_cx) lasar printer.
Does anybody know if it will connect to a serial or parallel port of
an ST or TT, and if I will need special drivers for it. I'd like to
get it going in Epson emulation mode for starters. It's got a DB-37
connector on it. Is it perchance RS-422?

Apparently Corona was bought out by CoreData (or KoreData?).
Anybody know of them, perchance an address or phone number?

3323. Re: Weird TT hard disk thingy

>>|>>turned out to be the problem. BOTH drives had to be set to SCSI 0
>>|>>to work. Extremely weird. Anyone have an explination?
>
>>Yes, but why does this explain why it will not work with an id other
>>than 0? I can see that if TT SCSI and ASCI are seperate buses then it is
>>ok to use the same id. Does this meen that the TT ASCI port only

On my Mega ST... I have no SCSI 0 drive. I use scsi 4 and 5 so I can
daisy chain a friends scsi 0 drive and still access my own disks.
But I can still boot... and use my hard disks w/o any SCSI 0 device
attached.

The fellow you've been chatting with says the TT won't recognize SCSI devices
1-7 on the ASCI bus, at least not without an SCSI 0 in place. Device 0 MUST
be used for the first device. Why????

3326. C Compiler, C++ Compiler

Newsgroup: comp.sys.atari.st
Date: 1991-04-24 19:11:40 UTC
From: davef@newbridge.com
Message-ID: <1991Apr24.191140.26978@newbridge.com>
Source record: 232765

I am looking for recommendations for a C compiler and a C++ compiler
for the 1040 ST. Price is not REALLY important if the software
is good quality. My only limitation is the store here in Ottawa
that sells Atari stuff is kind of small, so I guess well known
software makers would be best. Please e-mail me.

Thanks in advance,

Dave

> 1. Why is the TT being shipped with the old MEGA keybooard?

My TT came with the new style keyboard. Where were you told they are shipped with the old MEGA keyboard ?
The keyboards are compatible, if that's what you asking, and thus it should be able to upgrade
to the new style keyboards.
Anyway, I think the Mega-keyboard is very good, so I don't see the point in exchanging it.
(That said, the new keyboards aren't any worse, theyre just 'different', and anything new takes a little time to getting used to...)

3329. New VME Video card from Toronto Canada!

Newsgroup: comp.sys.atari.st
Date: 1991-04-24 22:53:56 UTC
From: Shervin.Shahrebani.Of.250/744@f744.n250.z1.FidoNet.Org
Message-ID: <672632008.0@egsgate.FidoNet.Org>
Source record: 232703

Have you heard of the new CyReL SKYLINE M16-1280? (Where do they
get these names?!?!) This is a RISC based 16 million color high
resolution graphics card for the Atari ST(e), MEGA, and TT030 range
of computers. The card comes with a VME interface for the TT030 and
Mega STE. An ACSI interface is also available as an option. This
is a Canadian product and it sounds amazing. Some of the specs follow:

Maximum display resolution:
1280 x 1024. Resolution is programmable in steps of four(horizontally
and vertically).

60 frames/sec non-interlaced for flicker-free display. PAL or NTSC
support. Refresh rates are programmable.

2 MB standard. Fast video RAM is used to store single or up to 262
screen buffers.

24,8,4r 1 bit/pixel. An 8 bit depth buffer option is available
in 24 it/pixel mode.

mode_........16,777,216 colours
mode_1.....................256 colours
mode_2.....................16 colours
mode_3.....................4 colours
mode_4.....................2 colours

Graphics sor:
32-bit high performance RISC CPU with built-in floating point
co-processor. It delivers a maximum of 20 MIPS and 1.5 MFLOPS.
Using the three 20 Mbit/s high speed LAN ports it is possible to
inter-connect several CyReL M16-1280 GRAPHIC CARDS to form a fast
graphics engine.

1MB(sa or 4MB(option) supported. Work RAM buffer is used to
store program & compressed graphics data, video parameters and
command
queues. Usage of RAM can be configured to support RAM DISK
functions,
hold caracter fonts or be solely/partly used by other CyReL M16-1280
cards n a network.

VDI difware on disk(standard) or in ROM (option) will enable
almost any VDI application to use the new high speed display with its
resolutions, colours and functions.

GENLOCK, TH SCROLLING & PANNING:
External video source can be used to GENLOCK CyReL M16-1280 images &

live video. Smooth hardware scrolling and panning allows virtual screen size management.

> available, or will I have to guess based on keywords in the Index file?
> Actually, I would be happy if someone just mailed me a list of
> files I need for the compiler to work.

I just spent a bit of time putting the gcc compiler on my hard drive. I tested it using the good old reliable 'hello.c' program. Here are the notes I made with regard to installation:

Files used:
GCC139B.LZH (current file on atari.archive has a corrupt GCC-CC1.TTP)
GCC139UP.LZH (may no longer be present, but it's where I got GCC-CC1.TTP)
MNTOLB8.ZOO (you -might- want to use it with MINT, so why not?)
MNTINC8.ZOO (ditto)

1. Extract all files EXCEPT 'gcc-cc1.ttp' from GCC139B.LZH (the file is corrupted in the current version on atari.archive). Place the files in \EXEC and set the environmental variable GCCEXEC to point to the directory.

2. Extract 'gcc-cc1.ttp' from GCC139UP.LZH and place the file into \EXEC.

3. Extract all files from MNTOLB8.ZOO. Place the files in \LIB and set the environmental variable GNULIB to point to the directory.

4. Extract all files from MNTINC8.ZOO (including subdirectories!). Place the files in \INCLUDE and set the environmental variable GNUINC to point to the directory.

Add the following aliases to your CLI's autoexec file. The following lines come from a slightly modified 'gnu.g' which came with my release of the Gulam shell. Check your CLI docs for differences in how environmental variables, etc. are set!

gnu.g
```
----- cut here ------
unalias cc
unsetenv TEMP
#
# set up commands for gcc and gas
#
alias cpp d:\exec\gcc-cpp
setenv cpp d:\exec\gcc-cpp.ttp
```

```
alias cc1 d:\exec\gcc-cc1
setenv cc1 d:\exec\gcc-cc1.ttp
alias gas d:\exec\gcc-as
setenv gas d:\exec\gcc-as.ttp
alias as d:\exec\gcc-as
setenv as d:\exec\gcc-as.ttp
alias link d:\exec\link
setenv link d:\exec\link.ttp
alias ar d:\exec\gcc-ar
setenv ar d:\exec\gcc-ar.ttp
alias ld d:\exec\gcc-ld
setenv ld d:\exec\gcc-ld.ttp
alias gcc d:\exec\gcc
setenv gcc d:\exec\gcc.ttp
#
alias cc d:\exec\gcc
setenv cc d:\exec\gcc.ttp

setenv FLEX_FAST d:\flex\flexfast.skl
#
# General
#
setenv GNULIB d:\lib
setenv GCCEXEC d:\exec\gcc-
setenv GNUINC d:\include
setenv TEMP g:
------ cut here --------
```

OTHER FILES YOU MIGHT WANT/NEED:

FLEX.ZOO - lexical analyzer
BISON.ZOO (where is this on atari.archive?!?)
DOCUMENTATION.ZOO - some nice-to-have documents in TeX format
DIFF115.LZH - can handle binary files as well as ASCII files
RCS5AP1B.LZH and RCS5AP1M.LZH - Revision Control System
GULAM.ARC - one of many CLIs which will work with gcc

Like I said, I successfully compiled a program using the above procedure (and I didn't have bison or flex or the documentation or RCS or diff...) so it is the minimum you need to do to get going.

If anyone has corrections, additions, suggestions about these directions, please send me e-mail so I can incorporate them into the next 'welcome to comp.sys.atari.st' ... I'll be working on minimal TeX / LaTeX instructions next.

3334. Can anyone suggest a 3D CAD package ?

Newsgroup: comp.sys.atari.st
Date: 1991-04-25 01:54:45 UTC
From: yegerleh@vivaldi.ecn.purdue.edu
Message-ID: <1991Apr25.015445.17022@noose.ecn.purdue.edu>
Source record: 232784

Dear Netters,

Does anyone know if any of the CAD packages other than Dynacad allow 3D drawings? How about Drafix? I also want to be able to do 2D detailed mechanical drawings, so something like the Cyber stuff is out, because as I understand it, it is mostly for solid modelling and not drafting. Dynacadd would be nice, but it's a bit pricey.

Thanks for the help,

Jim

You can also use the program "ratehd.prg". This is supplied by
the folks at ICD, and may be obtained at "atari.archive.umich.edu".

3340. Gnustuff

Newsgroup: comp.sys.atari.st
Date: 1991-04-25 04:30:44 UTC
From: davidd@cs.mcgill.ca
Message-ID: <1991Apr25.043044.10046@cs.mcgill.ca>
Source record: 232792

I was looking for the gcc compiler that some people had mentioned,
and I noticed that there was piles of stuff in the "gnustuff" directory at
atari archive. Is there any file giving a summary of all the gnu files
available, or will I have to guess based on keywords in the Index file?
Actually, I would be happy if someone just mailed me a list of
files I need for the compiler to work.
Also, as I was browsing in the gnu directory, I was pleased to find
a copy of Jove. I downloaded it, was somewhat surprised that it had no
documentation with it, and was disappointed when I found out that it seems
to not work with large files (it gave me a "cannot create temporary file"
message, and only part of the file was there in the editor). This happened
with two files I tried, both around 40k; it worked fine with smaller (10k
and less) files.
Does anyone have a working copy of Jove? Perhaps there's something
in my setup that it doesn't like (1 meg 1040 ST, Tos 1.0)? If Jove really
is bugged, could someone suggest another good pd text editor?

David D'Andrea

The following items are for sale due to the death of a friend.

If you are interested in any of the following, please call Don Allis at
716-293-3415 after 5pm EDT, or send a message to me at:

BITNET: clf3678@ritvax
USENET: clf3678@isc.rit.edu
BBS: 716-436-3078 (I'm the SysOp)

Arrangements can be made for shipping, except where noted. All offers
will be considered!

o Atari 1040 ST system. Includes CPU, SC1224 color monitor. The drive in the
computer was replaced with an Epson drive after the stock Chinon failed (a
BIG plus in my book). Also included is a PC-DITTO II board that WORKS in
this machine! Problem is, there MAY be a chip problem with it. It's being
included because the 68000 socket is soldered on, and not worth the time
to remove. Also included is an external 5 1/4 drive. $550.

o Panasonic KXP 1090i printer, excellent condition. Rougly 192 CPS draft. Some
extra ribbons and paper. $200.

o Avatex 1200hc Modem. Perfect working condition. $50.

o Computer desk. Commercial grade, very heavy duty and well-built. Also
includes a printer stand. $300. *** WILL NOT SHIP THIS ITEM ***

o Atari 130 XE computer, includes power supply. $75.00.

o Atari 1050 disk drive. Includes power supply and data cable. $75.00.

o Atari 800 with tape drive and all cables. $25.

o IBM Public Domain Software Disks (5 1/4) $1.00 each. approximate 250
disk to choose from. All 250 for $100.

o 5 1/4 disks. Approximately 500 blank disks. Some single sided and
some double sided. 100 disks for $20. 500 disks for $90.

o Right Handed Golf Clubs. Allied Colonials. 3 Woods, 6 Irons, and 2
Putters. Bag, umbrella, balls, tees, everything you need to play. 1
year old. $150.

o Kenmore 18 cu. ft. upright freezer. White in color. About 9 years

>
>Is it advisable to use Twister format with a 10 sec/track disk?
>Has anyone had any problems?
>

I use 82 track, 10 sec/track, twisted (as offered by Universal Item Selector
and Neodesk 3.0) for all floppies. Never had a problem. I have a
DC utility (MAXTRAK I think), which tests your particular drive to see
what the maximum format you can use is. I will put it on atari.archive if
it is not there already. Remember, different drives can do different things,
and Atari only guarentees 80/9 formatting. Just because I have no problems
does not mean you will not.

>Also, what is the correct RPM for a SS/DD disk drive? Can you adjust it
>easily?

300rpm, + or - 5.

>
>I have been having bad sector problems with my disks (And I use good
>quality disks, too.).
>

There are two common causes that I am familiar with.

1. You are using too "large" a format, as described above. This DC
utility should tell you if that is it.

2. Do you clean your drive heads? Suprisingly, if the answer is yes
that may be the problem. 3.5" drives are fairly enclosed, as are
the disks, and therefore require cleaning much less regularly that
the old 5.25" drives (I have never cleaned mine, in 2 years). Also,
the drive head is more sensitive (due to it's increased precision).
What happens is that folks that used to clean their 5.25" devices
all the time purchase a "cleaning diskette" for their 3.5" drives
because they feel it necessary. If this cleaning disk is of the
fibrus type, it can slowly abrade and score the drive head cover
(made of clear plastic) until errors start to occur. I was told to
never use such a cleaning device in a modern 3.5" drive. A q-tip
and some alcohol every few thousand hours is all that is needed
(and I don't even do that :-).

>
>Is it advisable to use Twister format with a 10 sec/track disk?
>Has anyone had any problems?
>

I've been using 82 tracks/10 sectors twisted for the three years I've owned an ST. Haven't had any problems.

DCMAXTRK, a PD utility by DoubleClick to determine the maximum number of tracks your drive can read and write to, says that I can go to 84 on my ST. Anyone know if it would be safe to go to 83 tracks/10 sectors twisted with this drive? I am also aware these disks may not work on another drive.

>Also, what is the correct RPM for a SS/DD disk drive? Can you adjust it
>easily?
>

I think SS and DS disks both go at 300rpm. To adjust it, I've heard that there's a small pot you can rotate.

>I have been having bad sector problems with my disks (And I use good
>quality disks, too.).
>

When I first got my ST, I bought Sonys and Maxells. Now, I only buy generic disks from MEI.

3348. Wanted: Symbolic math program for novice ST user

Newsgroup: comp.sys.atari.st
Date: 1991-04-25 07:38:43 UTC
From: dont@loop.uucp
Message-ID: <1991Apr25.073843.6040@loop.uucp>
Source record: 232808

I have a relative novice using an ST. I would like to obtain a symbolic
math program that will run on the machine. I was told there is a package
called 'Elcal' but have been unable to track down a dealer. If someone
has a copy they wish to part with, a source for the package at a reasonable
price, or knows of other packages that would do algebra-calculus-etc. I
would greatly appreciate any information.

The machine is a 520STFM but could be upgraded to 1meg if really needed.
It would be a definite advantage if the package were interactive and did
not require compilation of the source, etc.

Please reply by mail if possible
I will try to mail a summary if requested

Thanks

3349. METAFILE (Graphics) editor - Where can I get one?

Newsgroup: comp.sys.atari.st
Date: 1991-04-25 07:40:58 UTC
From: warwick@cs.uq.oz.au
Message-ID: <980@uqcspe.cs.uq.oz.au>
Source record: 232804

I am after a Metafile editor, or any info about the file format. Why?
Because Page Stream can import Metafiles, and I'm hoping this will allow
for outline graphics within Page Stream (which supports such graphics,
but not real well).

If someone can tell me more about Metafiles (I have NO IDEA at all!), then
I'd gladly write up a little editor.

Anyone?
Warwick.

3350. TEAC SCSI floppy summary

Newsgroup: comp.sys.atari.st
Date: 1991-04-25 07:48:20 UTC
From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <12649@uhccux.uhcc.Hawaii.Edu>
Source record: 232805

Thanks very much for all the comments and suggestions. This summary is posted now because there are questions about the ASCI/SCSI protocols and TOS and Amiga OS that would be better handled by this newsgroup.

Some people may be happy with the following price schedule obtained from a TEAC distributor in Anaheim, CA, J.D. Hannam [(714) 632-3458]:

```
-------------------------------------------------
| 2.88MB 3.5" SCSI | 1.44MB 3.5" SCSI
quantity | (FD-235JS-501) | (FD-235HS)
-------------------------------------------------
1 $192 $157
2-10 $185 $151
50 $180 $147
100 $176 $144
-------------------------------------------------
```

The single quantity prices are low enough so that a group purchase is not necessary. The salesperson, Tim, at J.D. Hannam, also said that they have only about 10 drives in stock and another shipment is expected in the third week of May. They also have a pickup window, so you can fetch your drive immediately.

Price quotes from Western Micro [(619) 453-8430] are about $30 higher in all categories. There is an East Coast TEAC distributor, Krystal, with phone number (212) 385-1900.

Most people might want to wait until some interfacing problems are resolved. The following things are required to operate the SCSI floppies:

1) SCSI adaptor (ICD is popular and ~$100)
2) SCSI floppy driver and formatting software (NOT YET AVAILABLE)

A powered case and SCSI cable are also required, although many people want to install the drive internally in a ST or PC tower case and use it as their "A" (but actually "C") drive, if possible.

Hopefully, anyone knowledgeable about the ST TOS and ASCI-SCSI protocols will offer us help. The basic question is whether anyone is willing to write the driver and formatter programs. Another concerns the procedure TOS performs at bootup. Will TOS interrogate the SCSI floppy and obtain its parameters? If so, then will it be able to boot up as a "C" drive with a formatted disk? Is a driver program needed at all, if the previous two questions are af-firmative?

Regarding the practicality of a 2.88MB drive:
It seems that people have widely differing opinions on the SCSI floppies and

the reactions range from "great" to one in the followup post: "crazy." :D Comparisons were often made between other drives with removeable media, such as the Syquest and the expected Insite Floptical, both of which are faster and have higher storage. The Syquest (~$375 bare), was said to have problems with reliability as well as costlier disks (~$70). The Insite Floptical will not be in full production until August (although Arrow Electronics is planning to sell the bare drive in June for $490, as well as an evaluation kit which includes a drive, single disk, utility software, OEM and programmer's manual, and mounting hardware for $685). The floptical disks, which hold about 21MB of data, will supposedly sell in the range of $20-25.

The range of reactions seem to stem from the fact that the 2.88MB floppy is an interim technology, so that people with fast, hard drives will see it one way, while people using 720K or low capacity hard drives will appreciate it more.

For people who prefer other manufacturers (Sony and Toshiba have indicated that they do not make embedded-SCSI floppies):

Chinon (213) 533-0274
Citizen (213) 453-0614
Epson (213) 534-4500
Mitsubishi (213) 515-3993
Panasonic (408) 262-2200
Sony (408) 432-0190
Toshiba (714) 583-3000
YE Data (404) 446-8655

The following is a list of 4MB ED (Extra-high Density) disk distributors:

Azerty 800 888-8080
Digi. Stor. 800 232-DISK
Intec (317) 290-0500
Neamco 800 225-2478

Thanks again to everyone for the information, which is believed to be accurate, but any correction and verification is welcomed.

3351. VKiller381 and DCDesktop Incompatible(?)

Newsgroup: comp.sys.atari.st
Date: 1991-04-25 11:05:23 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Apr25.110523.24554@rodan.acs.syr.edu>
Source record: 232811

I just downloaded vkiller381 from terminator (thanks for
putting it up there, Ed), but after I tried it and came back
to the desktop, my dcdesktop icons had been replaced by the
usual gem icons and the programs installed on my desktop had
become de-installed. I did not do anything while in vkiller,
other than look around (i.e. I didn't take any action on any
disks/viruses).
Just thought the dc and/or vkiller people might want to know.
...or others, who might run into the same problem.

First I must say thanks for all the responce to my last request for info. For those interested Uniterm was the only suggestion, and for good reason.

Now I would like to ask another question before I leave you guys (and girls) alone. Are there programs out there that can "untar" archives from unix on the ST? Also is there a program that can "uncompress" compressions made on unix (i.e. those with .Z extentions and those with .tar extentions for the above)?

Please e-mail replys to me Dennis st113@jetson.uh.edu

Thanks in advance,

-Dennis

3356. floppy compatibility problem

Newsgroup: comp.sys.atari.st
Date: 1991-04-25 14:20:14 UTC
From: PHB100@psuvm.psu.edu
Message-ID: <91115.102014PHB100@psuvm.psu.edu>
Source record: 232813

Greetings and Salutations.

I have a weird problem w/ compatibility between my ST floppies and the PS/2 mod 50 at work (DOS 4.00).

Floppies formatted on my ST show as empty at work ("file not found"). I then formatted some floppies at work, took them home and copied some files onto them from ST floppies. When I brought it back to work I got the "sector not found" error. I took it across the hall to an AT machine and got the same error on the external DS drive. When I tried a directory on the external HD drive, I got a garbage directory. On another Mod 50 I got the "sector not found." On a Mod 80 (running OS/2 1.3) the directory came up perfectly. I had to copy the files individually onto the hard drive of that machine, reformat the disks, and copy them back.

What's going on? I USED to be able to read floppies formatted on my ST at work. And why when I just copy files onto the disks does it mess up the directory?

Is are my floppy drives going bad? (this is the only explanation I can think of...)???

Thanx in advance.

In the dark no one can hear the color of your eyes.
Disclaimer: This is me. Do I sound like anyone else?

3357. Seeking a used ST

Newsgroup: comp.sys.atari.st
Date: 1991-04-25 14:27:00 UTC
From: rehrauer@apollo.HP.COM
Message-ID: <512f70ed.20b6d@apollo.HP.COM>
Source record: 232781

My trusty 520ST, purchased in 1985 (this was in the TOS-on-disk days), finally died (you don't want to know; trust me, it's dead). Though I'd seldom used it in recent years, my wife had become quite dependent on it for her word-processing and label-making chores. I knew I'd someday replace it, but I still haven't made up my mind "with what", and don't wish to spend a lot at this time. In the short-term, I want to spend little and protect my software investment.

So, since someone else always seems to beat me to the 'R' key on "for sale" ads, I thought I'd jump the gun and ask if there's anyone with a 1040ST, or 520ST upgraded to 1meg or more, who's thinking of selling? I don't need monitor or drives or s/w, just the CPU. If so, I'd be interested in talking price with you. I'm hoping to find something under $300, but if someone has a 2/4meg ST or STe they want to dump, by all means consider that a negotiable limit. Please send email to the address in my signature. Thanks (and apologies to everyone else for the bandwidth-wastage).

From: CSULLOGG@CRL.AECL.CA
Message-ID: <23921@know.pws.bull.com>
Source record: 232788

I ran into a very strange problem using Calamus (1.09N). I was in the midst of preparing a newsletter using Calamus on a Mega 2 with an SLM605 attached. Since the SLM605 needs a meg of RAM I had little available RAM for use. So, I simply grabbed a 1040STE wuth 4 megs (I'm a dealer, I can do that sort of thing) and continued on. However, whenever I printed anything, all objects (text, graphics, lines, etc) had what looked to be shadowing. However, the shadowing was ragged and made everything look out of focus. When I switched back to the Mega, the problem went away. I switched back and forth a couple of times to make sure that it was not a problem realted to one document - it happended with every one I had.

Anyone have ANY idea about this one??

>better than the regular TOS 1.4?

Grow and Shrink boxes have been removed, and the code that forces a redraw
of the window when it have been sized, also have been removed...
(therefor it isn't compatible with programs that uses fixed sized windows,
eg a window that is limited in the lower right-hand corner).

The program is NOT PD or SHAREWARE, you buy it as a upgrade to TOS1.04 on
disc. On the disc is a program that modifyes the TOS in rom and saves the
patched code on disc, ready for the Eprom-programmer...
Price is around 89 DM.

It is Acopy (eurosystems). And the memory is not dumped, it is ACOPY
that is FROSEN, when it asks for the destination disk.
PROREBEL is a illigal program, and so are the FILES compressed with it.

****
The .reb files contains a full working ACOPY!!! please remove these
files from atari.archive!!!
****

To prove that point - put the this program in the same folder as tcbdemoa.lzh
from atari.archive and start the is... (this works best on a color monitor
in medium rez.) the program loads the Acopy at the position it was frosen at,
if possible and starts it...

Hi me again...

After reading my statement that there are many adjustments inside the SC1224, some of you can't believe that I ACTUALLY made the adjustments when the monitor was ON, and my ST had an image on it.

Method: Turn one adjustment a little one way, and watched the screen, if it did something good, I turned it some more, if it did something bad, I turned it back.

Since I had already been stupid enough to make some adjustments, I fiddled with the rest of them and enlarged the screen, and played with the color.

AAron@sun.soe.clarkson.edu
I might be considered careless, but I felt daring and confident.
If you try this, you can be considered careless too!

Another good utility for formatting disks with twister is Mystic. It's a desk accessory that formats in the background. I've seen other background formatters and they're not as good. It will also do 82/10 format if you want. The down-side is that it won't format with a MS-DOS boot sector. If you have two drives, you can load up two copies of Mystic (MYSTICA.ACC and MYSTICB.ACC for example) and format two disks at the same time.

Message-ID: <1991Apr25.180634.18571@news.larc.nasa.gov>
Source record: 232820

Recently, my 314 drive was left on for an extended period of time (exact duration unknown, but it must have been a while)... I was rudely awakened one night by the sound of my drive motor (I think) on its last legs. Since then, when powered up, the drive makes a funny, irregular sort of grinding noise and refuses to function in any way, shape or form. Note that my ST wasn't powered up during the time that the drive was on, nor was there a disk in the drive -- I'd apparently just forgotten to turn it off.

My questions are:

1. What would be the most likely result of leaving such a drive powered up for an extended period of time (i.e. motor failure? some other sort of failure?)?
2. Can I do anything to fix the drive (i.e. replace some part or another), or such I just toss the thing out?

Thanks in advance...
John

P.S. Reply directly to me, if possible, since something like this may not be of general interest to netters.

On a related topic, I am considering replacing my 1040STf with a STE soon.
However, I would like to know of any incompatibilities that the programs
I plan on using may have with the STE.

I want to do CAD and DTP, so the 4megs of SIMMs would really be nice. This
is the main reason I'm thinking of getting a STE. The expanded graphics
capabilities and sound may be useful in the future, so I would appreciate
any info about those types of programs too.

I have CAD-3D 2.0 and the Cyber Studio line of programs, which I use now,
but I'm planning on getting DynaCADD and Calamus to do some serious work.
I also use Uniterm extensively for telecomm, and the Timeworks series of
programs for WP and DB.

Any info on bugs, general things to look out for with the STE, etc. would
really help.

Thanks,

Todd

P.S. I remember reading somewhere about a Super (enhanced?) Calamus that
is in the works. Anyone know anything about this? The post that mentioned
it was 2-3 months ago, and I don't remember it that well. I may hold off
on buying the present version if it is to be upgraded soon.

If formatted by ST's destop formatting program or by similar ones (difference being user interface and fancy sectors/cylinder or greater than 80 cylinders), the diskettes are unlikely read well by other machines. Apart from the fact that the low level formatting is neither IBM nor ISO compatible, the media descriptor byte in the boot sector may not be correct. And many msdos machines I have used so far don't bother other info on that sector. And of course the first 3 bytes must be 'jump ...' in 8086 machine language and not 'bra ...' in 68000.
The physical drive is very unlikely to be defective these days, but the interface can be very bad (genuine ATARI and IBM things may be OK.)

So did I. I was simply very lucky, not having been killed. I used a
well isolated screw driver and knew the most dangerous area of the CRT,
but there was a possibility of suicide. One should take the CRT to the
official service centre and have free fix when bought anew. Many programs
assume one inch length on the screen is correctly shown.

> says it does not know about statements such as :
>
> appl_init
> v_clswrk...etc...

The GEMFAST.H file doesn't provide the library functions; it merely
replaces GEMDEFS.H and OBDEFS.H, which define various useful
constants, structures, etc.

You need to explicitly include the aesfast and vdifast libraries as
command-line arguments to CC.TTP. (You can add a -GEM feature to CC
if you want, since you have the sources.)

I use MAKE instead. Here is a generic makefile that can be modified
for any GEM program under Sozobon C and GEMFAST. Note that there is
no rule in this makefile for turning .C files into .O -- MAKE knows
how to do that without any special training.

```
PROGRAM = my.prg
MODULES = my.o
CFLAGS = -O
LIBS = aesfast.a vdifast.a

$(PROGRAM): $(MODULES)
cc -o $(PROGRAM) $(MODULES) $(LIBS)
```

I keep my aesfast.a and vdifast.a files in the same folder as
dlibs.a, dstart.o, libm.a, etc. The LIB environment variable points
there.

I'm not sure how it happened, but all of the files I had on my
Atari Megafile 30 in partition D have become invisible. The problem
started when I was using Cheetah to copy some files from logical drive E
to D. For one copy it either said that it couldn't find the drive path
or that the drive path was to complex. I rebooted the computer and
used Cheetah to find out how much room was left on the drive. No files
or folders appeared but it said I only had 5 megabytes left when that
partition should have 6.5 meg free. So I know the files are still there
but how can I get to them? Thanks in advance for any help.
Jeff

> Jeff

Cheetah does non-standard stuff to achieve the speed that it does. It does not verify like conventional writes do (if indeed you do have verify on, which is the default). Therefore, as I'm sure the docs state, you use Cheetah at your own risk. I use Cheetah once in a while, but not for all of my copying.

If you get any kind of error while using Cheetah, I wouldn't use it for that drive. It seems that your drive may have been too heavily fragmented for Cheetah to find the drive paths, but that's just a supposition. If you get an error with Cheetah, I would question the integrity of the data on that partition. You should back it up ASAP and defragment it, or zero the partition and restore the backup.

I have put the PD version of El Cal (called Sub_Cal) on atari.archive. It is
a great program, and received heavy use by me during my undergraduate math
courses. All ordering info is included in the archive. You may find that
Sub_Cal has all the power you need (not much of it is disabled). Feel free
to email questions.

3388. Cartridge port hardware timing questions

Newsgroup: comp.sys.atari.st
Date: 1991-04-26 03:57:19 UTC
From: swanee@megadata.mega.oz.au
Message-ID: <1991Apr26.035719.17187@megadata.mega.oz.au>
Source record: 232832

Does anyone know what the timing constraints of the cartridge port (ST, MEGA, STE and TT) are? Without a DTACK or DSACK signal being returned from the port, what are the data setup times required to meet the internal logic timing for data transfer.

Bearing this in mind, the TT runs at a much higher clock speed, so does the cartridge port now also have changed timing requirements over the ST's? If so, does this mean that most of the older devices using this port may no longer work?

Any information regarding this would be greatly appreciated.

Thanks in advance,
Geoff Swan.

Try "AUX:". Also, "CON:" for the console.

3393. DESKJET printer drivers

Newsgroup: comp.sys.atari.st
Date: 1991-04-26 11:20:23 UTC
From: csuac@warwick.ac.uk
Message-ID: <D'B_66~@warwick.ac.uk>
Source record: 232844

After posting to this net to find out about the deskjet series of printers I finally parted with my cash and bought a Deskjet 500. I am very pleased with it but I do have a problem with drivers. At the moment I am using tempus to write reports and letters since I have the flexibility of adding control codes into my text. However this is slow and looks pretty sad on the screen. I have first word + but no driver for it. Ideally I am interested in purchasing a decent word processor that will make use of the features of the deskjet. For example, I will be probably be buying additional font cartridges at a later date. At the moment 'Thats Write' looks quite interesting. Does anyone out there use a deskjet and a respectable word processor that they can recommend.

Thanks in advance,

Paul

Ok, I have gone through 9 of the 10 levels (0-8). However, there are alot of areas in these levels that I just cannot get to. I'm being blocked by a pit, door, or imaginary wall (according to the map). Has anyone else had this problem? What did you do? I keep going up and down the levels getting nowhere. Also, there are alot of pressure plates that click but I don't see anything happening when they do.

One more thing. Is the DDD just a room full of demons or am I missing an important point here? Any help is appreciated!

> is there some way to accomplish this kind of activity?

The only reasons one would want to exit from Uniterm to the desktop would be to perform some task (e.g., run a program or transfer files from disk to disk).

The proper way to run a program would be to use the "RUN PROGRAM" selection from the Uniterm 'files' menu. I have run text editors and CLI shells using this method. It -does- require that you devote a certain amount of memory to the 'system' buffer. (Look up the "BUFFER" selection under the next-to-last menu ... I cannot remember the name, and Uniterm is at home...)

You can access UIS via the 'desk' menu in Uniterm as well. I've formatted disks and moved lots of files from disk to disk this way.

I also use DC Desktop, and have had no problems with this configuration (DC Desktop, run Uniterm, run program from within Uniterm) except when the program I wanted to run consumed too much memory.

I have also had a chance to exit from Uniterm back to DC Desktop (or any other desktop...) and then run Aladdin while still connected to my VAX at work (Aladdin allows me to run ZMODEM automagically on the ST ... I can set up a command file on the VAX and walk away for a few hours.)

The machine I was using for all this was a stock 1040 ST with TOS 1.0, plus a 20-megabyte hard drive and color monitor.

Hi ST fans,

Does anyone know if there are any Sound/Noisetrackers out there for
the ST.I have the Carebears Soundtracker Demo,but would like to know it there
are anymore out there,which are preferably Full versions??

Also does anyone know if any ST sound/noisetracker can load Amiga
created sound/noisetracker files??

And finally are there any other soundtracker related program and
information out there,like for example about the format of such files?

Has any one got any good tunes in any form??

Thanks in advance,

Alan Messer.

3398. Blank windows on the desktop?

Newsgroup: comp.sys.atari.st
Date: 1991-04-26 15:16:43 UTC
From: ldl2142@galileo.rtn.ca.boeing.com
Message-ID: <370@galileo.rtn.ca.boeing.com>
Source record: 232705

Just before christmas, I added a syquest 44M drive with an ICD+ host adaptor to my 520 ST system. At the same time, I also updated my TOS to version 1.4.

At some point since the, I've been having a problem with my desktop. Sometimes when I boot my machine, the default window to the root directory of my hard disk is empty and the info line reads "0 bytes in 0 files".o

After deleting my desktop.inf file, and creating a new one, the window now shows the correct contents of the C:\ drive at startup, but whenever I run an application, the desktop returns with a blank window titled "C:\" even if it used to be open to a subdirectory. If I click the close button the appropriate number of times to return to the root dir, the normal "C:\" window returns. However, if I repeat the process 3 or 4 times, I sometimes get a dialog box saying someting like "Can't access the ':' file or folder".

I've got a ton of programs in my auto folder, but disabling them doesn't seem to help. I've also got the TOS14FIX program (or whatever its called) and POOLFIX3. I'm also using version 5.10 (or 5.11) of the ICD driver.

I've tried reformatting my Syquest drive, but that didn't seem to help any.

If anyone has a clue regarding what's causing this problem, email or post a reply.

Thanks,

3399. Floppy Menu Program WANTED

I am trying a final time to see if anyone out there knows where I can find
a GDOS printer driver for a standard HP DeskJet printer. This is the first
time in years that I have posted a question twice and gotten no replies,
so perhaps my mailer isn't working correctly. I have been using postnews,
so this time I am submitting a follow-up article to see if it gets out.

I once hard of a product called "Turbo-Jet" (??) my NeoCept (??)
Anone else heard of this.

As a final straw (yes, I am this deparate), does anyone know of any good
cheap, word processors that use GDOS that come with a good DeskJet driver?
How about DTP programs? I have the original version of Fleet Street, but
it doesn't use GDOS.

Also, I recall seeing a review of some printing utility that came with
a GDOS driver for the deskjet. I printed in columns or something, I can't
remember the name.

I was at the store when they opened the TT! We were all rather disapointed.
Actually, when I was back at the store yesterday, I was told that Atari has run
out of the new keyboard and so they will be shipped with the MEGA keyboard
until they can make more of the TT board. Anyone with the old board will be
shipped a TT keyboard for no charge.

3402. SCSI floppy drivers

Newsgroup: comp.sys.atari.st
Date: 1991-04-26 18:00:20 UTC
From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <12670@uhccux.uhcc.Hawaii.Edu>
Source record: 232704

Many people have informed me that the ICD drivers have a good chance of working with the SCSI floppies, so ICD was contacted.

Howard Peters, systems programmer of ICD [(815) 968-2228, FAX: (815) 968-6888] stated that while he was unsure whether current ICD drivers and utilities are compatible with the TEAC SCSI floppy, it would be very easy to configure them for that drive. He also said that he would make any necessary adjustments to the present software, when he receives the TEAC SCSI manual [FC1-01 Software]. If anyone has access to GEnie or CompuServe, please confirm this with their online personnel and note the TEAC FAX number (213) 727-7621 so that Mr. Peters may obtain the manual.

This is very nice of Mr. Peters and ICD, Inc., so I hope everyone finds some way to thank him and his company!

If anyone has ordered the TEAC SCSI floppy drive, please inform the net and also let us know about compatibility with current software drivers and utilities. Also, if anyone has contacted other disk drive manufacturers, please post your findings regarding 3.5" SCSI floppies [manufacturer, model #, manual, distributors], in order to eliminate redundancy.

Thanks,
Jack

I know of one such book (the author's first name is Ralph, cannot remember
the title) that is a good beginners guide to the ST. One place that sells it
is Computer Garden (1-800-456-5689), for $15.99. I would also recommend that
you get a subscription to Current Notes magazine (about $20). It is the
best (IMHO), with many _honest_ reviews and a great PD library. I liked it
so much that I bought all the back issues.

I think the problem is you don't link the libraries aesfast.a and vdifast.a
with the object code of your program.

So if your libraries are located in e:\sozobon\lib and your program is called
gemprg.c, your command line should look like the following:

% cc -o gemprg.prg gemprg.c e:\sozobon\lib\aesfast.a e:\sozobon\lib\vdifast.a

The files aesfast.a & vdifast.a come with the gemfast package

Wait a minute: I thought that El Cal (and therefore Sub Cal) is
purely a numerical tool. The original poster asked for a symbolic
math package. The only ones I know of are form, available for free on
atari.archive, and Maple. Form is very general, but ha a steep learning
curve, and requires that you program (recursively) in its own language.
I saw a post a while ago that mentioned that Maple has been ported to
the ST (~$400?), but I don't know anything beyond that.

>

Unfortunately, my advice won't help you with your major problem, but I think you need the POOLFIX version which has been adapted by Claus Brod and implements the XBRA routines. Atari's version(s) of POOLFIX don't get installed if they are run after hard drive booters, such as ICD's. They must be run BEFORE any hard drive booters, and this is impossible with ICD's, if you have it configured to autoboot from the hard drive.

Claus Brod's implementation used to be called POOLFIX4, but has been changed to something like PLFIX_CB.

Paul Baughman asked about a sudden disk incompatibility between his ST and IBM PC systems.

I'd recommend checking the disks with a Virus Killer, such as VKILLER immediately... a virus on the ST will overwrite the boot sector of a disk, wiping out the media descriptors that MS-DOS looks for. The disk will still show a directory on the ST, but will either display an empty directory on the IBM, or not be readable at all.

It's possible that OS/2 (on the one IBM system that could read the ST disk) may not look for the same information in the boot sectors as MS-DOS does.

There shouldn't be any worry of the virus spreading to the IBM system, but every ST disk in your library may have to be checked and disinfected.

(I went through a baffling afternoon tracking down just this same situation not long ago..!)

David Merrill asked:

>I have just acquired an ST. Is there any good books that cover
>the basics of system operation. The documentation from Atari is lacking.

Most of the companies that produced books on the Atari ST have either gone out of business or have dropped their Atari line. One significant exception is the book Mickey Boyd mentioned. It's title is:
"The Atari ST Book" by Ralph Turner, and it covers everything you wish Atari had told you about the ST.

It's available from the publisher, Index Legalis at (515) 472-2293 and costs $16.95 plus shipping.

Also available is an intermediate and advanced book, "Atari ST Subjects" at the same price.

Yeah, Mystic has very bad, if any, error checking. It would be nice if
it had a verify button, like DC Format does, as well as some of DC Format's
other features.

Last I heard, there are not any Atari programs which would benefit from font cartridges for the DJ. Though I'm no atari guru, I cannot recall of any atari word processor which deals with printer based fonts with any grace. Right now, I am using WordPerfect to try and exploit the DJ's features, but WP is just not cut out for the task. The Atari WP is meant for older dot matrix printers. I can say one thing for sure: WP will not switch fonts well.

One way to get around this problem is to use GDOS (or any other system that bypasses the fonts in the DJ) to dump the text to the printer in graphical form. A word processor like Wordflair or WordUp will do this. TeX will also do this (and there is a DJ driver for TeX too.)

I have a Lynx and play it regularly. I only have California Games, Blue Lightning, and Roadblasters. I am looking to get Shanghi real soon, but only after my WEDDING on MAY 4th....

There are others here that have much more than I do. I really enjoy my Lynx, but all I have are fast action games, and kinda want Shanghi to slow things down and exercise my brain a bit.

If you want more info, read rec.games.video and you will find a GREAT discussion (snicker) about the various portable game machines...

Ok, I know this is not the place, but a few days ago a new newsgroup was created and on the first day it got 76 messages posted there. On the second day, trn reported it as a bogus newsgroup, i.e. it was already removed.

My questions: 1) why would a group that gets over 70 messages its first time out get canceled, and 2) whom do I complain to to bring it back.

I know we here in c.s.a.st would never worry about this happening to us, but it did happen to another one I read and would very much like to see that newsgroup come back.

Thanks for any responses I get...

In article <91115.122751ONM07@DMSWWU1A.BITNET> ONM07@DMSWWU1A.BITNET (Julian F. Reschke) writes:

>First of all: who said that KAOS 1.4.2 is so much better than TOS 1.04?

I guess, at least two, namely the developers :-)
But seriously, aren't there still some deficiencies which could be cured in TOS 1.4 (B.t.w. why 1.04?)? And why is KAOS praised to be the ultimate TOS 1.4 patch, which is my impression while looking at some reviews in german magazines? Two arguments I would accept are:
- improvements are mainly marginal
- degree of incompatibility is to high.
Any advice is appreciated.
Latest news (I know of): there's no EPROM service at the time, due to licence problems.

The version I was offered, which was a disk set without manuals (I was told that the Mac version of the manuals was sufficiently close as to be useable) was $80. Now, that was through the University of Waterloo's computer store, and I am a FT student there, so there must be some discounting.

But $400? That does seem a little steep (not for Maple, which is an excellent program, but in comparison to the price I was quoted).

I've got tons of disks formatted at 80 tracks, 10 sectors/track
(double-sided) for 800K in twisted format. I now want some of these
disks to be MSDOS compatible. I used the program Diamond Format
which is capable of writing a MSDOS boot sector without reformatting
my disks, however MSDOS only recognizes the first 360K on the disk.
I presume it writes some type of info on the boot sector to indicate
the number of tracks and sectors it was formatted in. Could someone
tell me where it is so I could use a disk editor to manuall change it?

>dot matrix printers. I can say one thing for sure: WP will not switch
>fonts well.

I use the word process ProText v5 by Arnor. It is not GEM based
(which I like), and handles multiple proportional fonts flawlessly,
microspacing et al. The printer driver is fully configureable, so any
new fonts can be easily added (although the width table can be a pain).

I highly recommend ProText.

Red/.

3428. Patch for GEM-Output

Newsgroup: comp.sys.atari.st
Date: 1991-04-28 14:14:44 UTC
From: jan@janhh.hanse.de
Message-ID: <7616318@janhh.hanse.de>
Source record: 232234

Hi folks,

while looking for a prgram that could print out my metafiles,
I found out that my version of GEM-Output couldn't save it's list of
output files. It always created .LIS files of 0 bytes.
(I have version 1.2 of August 7th, 1985; it's 60550 bytes long, but the
length may vary due to he present/not present symboltable)

So here is the patch. Use a filemonitor to put the following
bytes at the given addresses (relativ to the beginning of the file).
Be sure to try this on a copy first!

adr.: new code:
$45ba: $4e71,$4e71,$4e71,$4e71,$4e71,$4a39,$0001,$b664
$461a: $0000
$4622: $0000,$b664

The problem was that "Save as" created a new file via Freate without
closing it and then branched to "Save" which opened the same file with
Fopen (write mode). I guess that worked with older versions of TOS, but
doesn't work on present ones. Now it always uses Freate.

I've been told there are versions of GEM-Output that don't have the
this problem. See for yourself.

Standard disclaimer: Everything you do is on your own risk! I keep the
copyright to the patch just in case some magazine
might want to publish it. :-)

Happy trails,
Jan

PS: I keep hearing of an OUTPRINT.PRG. Is that equivalent to GEM-Output ?
What's the legal status ?

3429. Hard disk alternatives

Newsgroup: comp.sys.atari.st
Date: 1991-04-28 16:27:23 UTC
From: gjocc@csv.viccol.edu.au
Message-ID: <1991Apr28.112723.6633@csv.viccol.edu.au>
Source record: 232744

I am planning to buy a Mega STE or TT (I currently have a 1040STFM).

Discussion of the TEAC 2.88MB floppy drive reminds me of one of my
pet plans.
I am looking for alternatives to fixed hard disks for mass storage
because of

1. High cost for fixed storage capacity.
2. Backup problems.

I am thinking about floptical drives (high denstity floppy disks using
laser head guidance about 20MB capacity) and magneto optical drives
such as the type used in the NeXT cube (about 256MB).
I am not interested in the Megafile 44 type drive as I consider the
media (Disk carts) are too expensive.

Speed is not an important consideration, these devices are faster than a
ordinary floppy anyway. (It is the storage capacity I want)

These type of drive mechs are available with SCSI interfaces.

I would like to put the following questions to the Net:

1. Does anyone have any information on pricing, specifications
and availability (in one off quantities) of these types of
drive mechanisims.

2. How hard will it be to get one of these drives working with a
Mega STE or TT? Will the Atari supplied hard disk software be
sufficient?

3. Does the version of the Mega STE that comes without a hard disk
have the ASCI to SCSI converter or does that only come with a
hard disk model?

I will summarize to the Net if there is any interest.

Greg O'Sullivan

3430. Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1991-04-28 18:17:08 UTC
From: aa400@cleveland.Freenet.Edu
Message-ID: <9104281817.AA05923@cwns10.INS.CWRU.Edu>
Source record: 232728

I downloaded the sozobon c compiler from the atari archive, and put all of the un-compressed files into three folders. All files in sozobon1.zoo were put into sozobon1, etc... The strange thing is that there were several makefile files that just overwrote one another. There were also several other files that overwrote one another. Should these files have uncompressed into folders?

Anyway, I am having a lot of trouble getting used to C, and the sozobon compiler. If anyone could help me with getting started using C and the sozobon compiler, I would really appriciate it.

Thanks in advance.

Someone asked what a link virus is so i might as well tell you all :-(
It's a small programs that "pastes" on to a program file in such a way that
each time you start that program the virus is run too... An example
of a link virus is the "crash virus". The first x times a
contaminated program is run it infects another file, but the x'th time
you try to start the program it's just "chrashes" with 3 bombs and you
will never be able to run it again. This virus spreads FAST !!! And
if you get it on your HD you are in GREAT trouble. By the time my
friend got the first "crash" all the PRG files on his 20 MB was
infected and there is no way to restore them :-(So watch out !!!

Message-ID: <9104281836.AA06500@cwns10.INS.CWRU.Edu>
Source record: 232730

I donwloaded the following files from atari.archive... SOZOBON1.ZOO, SOZOBON2.ZOO, and DLIB.ARC. I wanted to get started using C, but I am greatly confused when using sozobon. First off, when I de-compressed the sozobon2.zoo file, many of the files had duplicate filenames (makfile, for example). They just overwrote one another. Should these files have un-compressed into folders or something? (I am using BOOZ.TTP to decompress the ZOO files..)

Anyway, if there is a C guru out there that has used sozobon c before, and would be willing to help me out getting started with C, please mail me. Also, if you are a machine language guru, please mail me to help with get started in assembly. I have Devpac 2, but I don't know where to start.

Thanks in advance.

3434. Details of the "Great Lakes Atari Computer Users Conference 91"

Newsgroup: comp.sys.atari.st
Date: 1991-04-28 19:40:47 UTC
From: a644690c@edinboro.edu
Message-ID: <3511@edinboro.edu>
Source record: 232574

```
*********************************************
* GREAT LAKES ATARI COMPUTER USERS CONFERENCE *
* June 29th and 30th, 1991 *
* Mercyhurst College Campus Center *
* Erie, PA *
*********************************************
```

The Great Lakes Atari Computer Users Conference will be held Saturday, June 29th, and Sunday, June 30th at the Mercyhurst College Campus Center in Erie, Pennsylvania. Erie is located on the southern shore of Lake Erie midway between Cleveland, Ohio and Buffalo, NY. It is within an easy drive of many other major cities including Detroit, Chicago, Columbus, Cincinnati, Pittsburgh, Rochester, Toronto, London, Syracuse, and Albany. Many of these cities have strong user groups supporting the Atari computers who will be participating in this event.

With fourteen flights daily, USAir provides the primary air service into Erie International Airport and is the host airline for the conference. For conference attendees traveling by air, USAir is offering 35% off regular round trip coach airfares and an additional 5% savings on published discount fares. Call 1-800-334-8644 (800-334-8644 Ext. 7702 from Canada) for reservations or additional information. Refer to Gold File Number 13190000 and the Great Lakes Atari Computer Users Conference.

Most national motel chains are represented at the seven exits off Interstate 90 which provide access to Erie. Rates are reasonable and well below national averages.

Mercyhurst College is located at 501 East 38th St. and is easily accessible from Exit 8 (PA Route 8 - Pine Ave./Parade St.) or Exit 7 (PA Route 97 - Glenwood Park Ave.) off I-90. Signs on the campus will direct you to the ample parking areas near the Campus Center.

Show times are 10 AM to 6 PM on Saturday and 10 AM to 5 PM on Sunday. Tickets are only $3 at the door. Advance tickets are available through participating user groups and by mail at the discount price of $2. Door prizes drawings will be held throughout the day. Seminars on technical topics and commercial products for the Atari computers will also be offered on a continuing basis.

To order tickets by mail, register as a seminar speaker or reserve exhibit space write to GLACUC, P. O. Box 10562, Erie, PA

16514 or call Patty Marshall (Vendor Contact) at 412-225-8637 or
Dennis McGuire (User Group/Seminar Contact) at 814-833-4724.

3435. Going from X11 to GEM

Newsgroup: comp.sys.atari.st
Date: 1991-04-28 19:42:06 UTC

Message-ID: <1991Apr28.194206.1750@oz.plymouth.edu>
Source record: 232734
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

(for those who care --> follow-ups directed towards
comp.sys.atari.st.tech where they belong)

This is really a hypothetical question......
There is a program called "viola" that is sort of an X11 (x
windows) version of hypercard.

Does anybody have any experience porting programs built on the X11
model of client-server programs to GEM (or anything else) on the ST ?
(I know..... I COULD wait until I could afford a TT and *nix..)

I'm pretty sure it's been done already --> for example... the program
contained in texdraw.lzh in /atari/tex on atari.archive.umich.edu ...

Anyone got any ideas ??? Comments ???

jbleaza%peruvian.utah.edu@cs.utah.edu (Jason Bleazard) writes:
+
+Sozobon expects this really arcane method of passing parameters.
+In the above example, try:
+
+ main(argc, argy)
+ int argc;
+ char **argy;

Arcane???!!! Try as documented in the K&R white book. The ANSI
standard method what is listed below. Some notable and wide spread C
compilers, such as Sun OS4.1, still use the 'arcane' method.

The ANSI method also allows the 'function prototype' to be used and
the syntax is the same for either the prototype or the function
definition, where as the K&R method would have been a botch.

E.g. in ANSI
int funct( int p1, struct str *p2); /* function prototype. */
...
int funct( int p1, struct str *p2) /* function definition. */
{
......
}

This concept is a 'logical' extention of the C idea that one can
'add' to the definition of a variable as one proceeds, such as

extern int array[]; /* first mention of 'array' and typing it. */
....
int array[100]; /* Further definition. */

This allows the 'include' files to declare 'array' external for all
modules using 'array' and also allows array to be defined explicitly
as required in the definition module.

In article <12649@uhccux.uhcc.Hawaii.Edu> kiki@uhunix1.uhcc.Hawaii.Edu (Jack W. Wine) writes:
+driver and formatter programs. Another concerns the procedure TOS performs
+at bootup. Will TOS interrogate the SCSI floppy and obtain its parameters?

The TEAC SCSI Floppies I've worked on do not 'sense' the format of the disk in the drive. They require a 'MODE SELECT' SCSI command to configure them to the 'desired' density. If you wish to support multiple densities or a density which is not the 'default'(I think it's IBM 720K) then the TOS startup will have send the different configuration to the drive. I don't think TOS naturally does this.

Also on the drive, at least of Rev G or lower, is a 300 ms powerup wait time where the drive does not respond to "UNIT READY" commands and so if your init routines buzzes the device before the 300 ms is up you get the impression that the drive is not there. Many 'Hard' disks at least repond to 'REQUEST SENSE' and 'UNIT READY' with a 'I'm busy' response. The TEAC appears dead.

From: burnett@mentor.cc.purdue.edu
Message-ID: <11497@mentor.cc.purdue.edu>
Source record: 232733

I am having trouble with the new version of Sozobon C compiler ...
I have a compact disc database that worked fine with the old version,
but with the new version, when I malloc space for a new cd record,
it doesn't work. THe statement I use is:

```
tmp = (struct cd_rec *) malloc (sizeof(struct cd_rec));
```

Whenever I try to copy a string into the structure (tmp), I get 2
bombs. This porgram worked fine with the old version and I changed
nothing when I tried to recompile with the new version. Any one
have any ideas?

Source record: 232737

I just wanted to know if all of you USEnet readers can access the
Cleveland freenet's atari sig area via usenet. There are several
newsgroups in the atari sig on freenet, and if you can access them
using usenet, try posting there. The SIG is huge, and there
are several categories for atari posting. But, there are several
advantages to logging on to the freenet. Try using the following,
if you can...

freenet.sci.comp.atari.general ST and 8-bit discussion
freenet.sci.comp.atari.news Atari News!
freenet.sci.comp.atari.forsale Our wanted/forsale area
freenet.sci.comp.atari.prog Our HUGE programmers SIG. There
are several sub-sections to this one..

Please reply via mail to whether you can read freenet newsgroups or
not. If you can't, you can always get registered with the Freenet.
Everthing is completely FREE!

telnet freenet-in-c.cwru.edu

I'm sure Dave Small's original intention

was to release the emulator completely on a disk. Remember, however, that
Apple is a company that sues anyone, no matter how big or small, that
steps in it's path. They sued Microsoft, a company that if it weren't
for their early support of the Mac, Apple might not even
been successful with the Mac and and be quite different
from the giant it is now [not to mention Steve Jobs ego. d:^].
They sued Hewlett-Packard, another company that Apple
I doubt very much that it would have been a wise move on Dave's part
to do it. [after all, the reason why the Mac operating system is so
easily emulated is because Apple's hard work at developing an operating
system elaborate enough to keep programmers away from doing any low
level hardware stuff]. The Macintosh hardware is nothing. It's that
128k that makes up the ROM that is the Macintosh.
The reason that PC Ditto resides on a floppy is because someone took the
copyrighted bios and wrote a compatible one without somehow
infringing on IBM's. Perhaps [although, this is only a guess] IBM
might have tried to stop it purely because their BIOS and the cloned
BIOS are identical in the order of the system calls but since
the same goes for CPM which was developed many years before
IBM ever thought of doing a personal computer.
I read somewhere that a company successfully wrote a legal
clone of the Mac roms so you may see a disk version emulator that is
legal.

Um, excuse me? I have an original Magic Sac; it's a cart with two
gen-you-wine Mac ROMs in it, and a couple of flops with the software.
That sounds like the legal minimum of hardware to me. This product
has been around for just ages; at least three years.

Don't confuse this with some of Dave's other stuff, like the GCR
product, that needs extra hardware to handle Apple disk-format
idiosyncracies. Or the '030 based boards, which must have an '030
plus glue in them (at a minimum) to deliver the big performance boost
that makes them worth owning. As a matter of strongly held personal
opinion, Dave's work has been a pretty darned good deal all round.
What research have you done before jumping in with all these
accusations and factoids?

Oh, and while I'm flaming (1/2 :-), why don't you learn to use a shift
key, a spelling checker and a text editor? Beyond that, a few spaces
after the `.' ending a sentence do wonders for legibility. Your
grammar is also pretty weak, but I'll pass on that for now.

>files have un-compressed into folders or something? (I am using BOOZ.TTP to
>decompress the ZOO files..)
>
Ha! finally one that I know the answer to, and that no one else has already
answered! The sozobon*.zoo files have subdirectories, and must be unpacked
with the 'x//' command to work properly -- otherwise, they will overwrite
each other (as you saw) and the files don't end up where they are supposed
to! If you are using a shell, like gulam (I think that the sozobon developers
mostly use gulam) then unpack as follows:
zoo x// sozobon1.zoo *
If you are doing it from gem, zoo must be a .TTP file, and you give the
'x// sozobon1.zoo *' as the command line. Note: I think someone said that
this doesn't work before TOS 1.4 because earlier TOS's converted TTP arguments
to upper case -- I don't know. The best way is probably to use one of the
shells that lets you select the sub-directory extraction as an option.

Did I get it all? Flame me if I messed up on this one, but I think that's
how it goes.

The Spectre and Spectre GCR is a cartidge to hold the Mac ROM and a software driver to interface the ROM to ST. So it already is doing the legal way. The only other legal way to emulate Mac without the ROM at this time is a company in CA. just annouced not too long ago that they have a clean room clone MAC OS which have not legally tested. (i.e. Apple have not file any law suit nor the court has say it's not infringe Apple's right. They are waiting to see who is going to take the first shot from Apple). There is no cheaper solution until that clone ROM pass its legal challnge, and Mr. Small is not big enough to take that chance. (Beside it's better for him to spend time in making better products for ST rather than spend time in court, Don't you think so?)
Well, just my 2 cents.

Hi Ed,
I am not sure that I still have it, but I will look around for
it anyway. "It" is Dcopy 3.14, I used it quite a bit in the past for 8-16 bit
text conversion. Hopefully I can find it; if not, maybe someone else has it.

Source record: 232672

I also have had problems printing with a deskjet 500. It concerns mostly the actual page area available for printing. It seems to me that it is physically impossible with this printer to use the top and bottom inches of each page. Does anyone have any hard information on this? I am using timeworks DTP. (The only thing I can find in the printer manual is a statement the the printer cannot use the bottom half-inch of the page, no mention of the top of the page.) It is a real hassle when headers appear hallfway down the page (O.K. I'm exaggerating....)

Why do you say that? I autoboot my hard drive with ICD's booter all the time, then run POOLFIX3, the TOS14FIX. POOLFIX3 says it is installed and I never have any problems. Is there some reason that POOLFIX3 would *not* install and still say it was? Please explain.

>the FoReM & ///Turbo x-nets), and many people would like to get these fix
>files for TOS 1.4.

First I have to point out that the 'KAOS 1.4.2'-Fixes are copyrighted. So an upload to atari.archive is illegal !

>BTW, what kind of bugs were fixed in KAOS TOS 1.4 that makes it so much
>better than the regular TOS 1.4?

I don't really not what bugs were fixed but I know that KAOS sometimes sends different result codes - compaired to TOS 1.04. So if you'd have any problems with other programs you can't claim any support services, especially from ATARI !

> Cleveland freenet's atari sig area via usenet. There are several

Nope. Freenet discussion groups are not part of Usenet. Usenet is netnews in the seven major hierarchies, and that's all.

Freenet is accessible to Internet sites*, but they are only a fraction of the Usenet.

Freenet could set up a digest-by-mail service if it chose to do so. Many of the Usenet newsgroups are delivered as digests to sites that, for whatever reason, cannot receive conventional Usenet service.

(*Internet sites are systems running Internet TCP/IP network communications protocols AND connected to a regional network that is a component of the Internet. Such connections can be extremely expensive, so most smaller businesses and private sites get email and Usenet through other methods, such as UUCP. Domain addresses do not indicate that a site is on the Internet.)

3462. Where are .ACCs loaded from?

Newsgroup: comp.sys.atari.st
Date: 1991-04-29 14:08:18 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Apr29.140818.6726@chinet.chi.il.us>
Source record: 232563

What's the true recipe for determining where desk accessories are loaded from? Is it TOS version dependent? I'm trying to set up multiple environments with boot floppies, and somehow, even when the AUTO folder on drive a: is used, even when I tell SUPERBOOT to use accessories from a:\ (and it offers a menu of them), SOMEHOW the desk accessories always seem to get loaded from c:\ (and none of the hard disk partitions is marked bootable). Am I going to have to take desperate measures like running the hard disk driver from the desktop? What's a tinkerer to do?

For clarity: Mega 4 ST with TOS 1.2, 1 floppy (internal); ST296N connected to a BMS-200, divided into partitions of 15, 15, 22 and 22 megs (none bootable). AHDI, FATSPEED, FOLDR150, SUPERBOOT, QuickST.

You can do better than that. DESKTOP windows use a mask to display
files, so you can edit DESKTOP.INF to display only files fitting that
mask. It's not perfect, but open two windows and use one with mask
*.PRG and the other with mask *.T?? to get applications. However, each
directory needs its own windows.

Aiiyee, enough! Close, Sesame! :-)

It seems that quite a few of you have used ST's that you'd like to sell. Since posting my request, I've discovered that I've been out of touch with the Atari market; for example, I hadn't realized that one can buy a new 1040STe for as little $399 (from Toad Computers -- this is obviously w/o a monitor, which is no problem for me. However, Toad currently have none to sell, claims that no one else does either, and were unable to tell me for certain when they'd be restocked). I've since found a deal (possibly two) on a used machine(s) that makes me happy. Thanks to all who responded.

Yes, its called DESKTOP and it comes in rom;
Just save the screen with windows positioned over the applications (having
sorted by type) and save the desktop, now whenever you boot up the computer
will show you a menu of the programs and whats more they can be selected with
a mere double mouse click.

Desktop even knows about non gem applications (and you can install gem ones
as non-gem ones etc)

sarcasm off

Really, I don't know why you need it!
except for auto programs, for those I use a batch file processor like
the mint init program to run these, this lets me put the actual programs in
sensible directories. To change the boot sequence I edit the startup script
like any good unixoid.

>The fellow you've been chatting with says the TT won't recognize SCSI devices
>1-7 on the ASCI bus, at least not without an SCSI 0 in place. Device 0 MUST
>be used for the first device. Why????

[Am I "the fellow [he's] been chatting with"?]

I can't speak for what SCSI unit numbers ICD or Supra adaptors will or
won't recognize. From the data presented here, it sounds like ICD will
handle any SCSI unit number on the drive, and Supra will only talk to SCSI
unit zero. The latter is not unreasonable -- if you've got only one drive
on a SCSI-to-ACSI converter, why include the logic to talk to an arbitrary
SCSI device number? It would mean logic in the adaptor to see what SCSI
drives are out there.

I have even heard of some adaptors which look at the SCSI unit number of
the drive that's connected, and configure themselves as that ACSI unit
number, further confusing the issue.

As for the ST/TT side of the bus, you have to start with zero on each bus
and increment by one for each drive you connect to that bus. (Remember,
that's unit numbers as the computer sees them, not as the adaptor sees the
disk it's actually talking to.) The reasons for this are kind of involved,
and I don't want to go into them; just take my word for it and carry on.

I hope this clears up the questions about busses and unit numbers, and we
can get on with our lives.

> I presume it writes some type of info on the boot sector to indicate
> the number of tracks and sectors it was formatted in. Could someone
> tell me where it is so I could use a disk editor to manuall change it?

Maybe this should be in c.s.a.s.t but ::

MSDOS less than version 4.X is very stupid about disk formats, they use
the media descriptor byte in the boot sector and not much else to tell
them about the disk format. (HO- Hum) The ST is much cleverer than that
and uses the MSDOS header in the boot record to identify the type of disk
by interpreting the number of tracks/sides/sectors/track properly.

in summary:

MSDOS
Is it a 360K 9 sector disk .... no ?
well is is a 1.2 MB ? no
.. ad nauseum

TOS.
Oh the header on the disk says its 82 track .... hmm ok then
it says it has two sides ... Ok
Oh it says there are 20 sectors per track >> hmm outlandish but if you say so !

therefore disk capacity is 82*2*20*0.5 K

Sane eh ??

MSDOS 4.X and above do it the ST way (took em till V 4.0 to get it right)

(Maybe Atari should sue for look and feel of the floppy driver)
(Then again IBM would probably counter sue against the data-structure
of the boot record)

Therefore the moral of the story. Use DOS 4.x even though its a dog.

BOB
R.Lunnon@qut.edu.au

PS: Note that some PC controllers particularly those with the older
UPD765 Floppy contoller (as opposed to the A model) cannot read disks
with short gaps that the ST formatters often write ('spec 11 sector formats)
This really only applies to 360K floppies if you have a 5 1/4 " drive.

PPS Dos 4 seems to be able to read TOS1.0/1.2 Disks as well ('bout time)

In article <41919@ucbvax.BERKELEY.EDU> kawakami@locusts.Berkeley.EDU (John Kawakami) writes:
`Last I heard, there are not any Atari programs which would benefit from
`font cartridges for the DJ. Though I'm no atari guru, I cannot recall of
`any atari word processor which deals with printer based fonts with any
`grace. Right now, I am using WordPerfect to try and exploit the DJ's features,
`but WP is just not cut out for the task. The Atari WP is meant for older
`dot matrix printers. I can say one thing for sure: WP will not switch
`fonts well.
`
`One way to get around this problem is to use GDOS (or any other system that
`bypasses the fonts in the DJ) to dump the text to the printer in graphical
`form. A word processor like Wordflair or WordUp will do this. TeX will
`also do this (and there is a DJ driver for TeX too.)

My G-Print application will also do this. The current version cannot read Word Perfect files, but the next one will. Right now, it supports 1st Word, Word Writer ST, 1st Word Plus, and ST Writer (as well as ASCII). Please contact me if you have any questions.

Yes, there is one good SoundTracker program that I know of. It is called
DigiSound and can be found at atari.archive for downloading. It is great
for playing Amiga .MOD files, but I do not now how well it stacks up to
other composition programs for writing files, since I have absolutely no
musical talent..:) It LOOKS complete, but that isn't a very good guide
to go by. It plays the .MOD files excellently, and it is PD/Shareware.

Here in Finland we are getting TT's with Swedish ROM,
and there seems to be some problems in them. Also
my friend does not like so much for Swedish as language
for a computer. So I would like to know if it would
be possible to have an English TOS for TT.

If someone could sell us one on disk or ROM.

Our situation here is very difficoult as the
distributor is closing its' bussiness, so they can not
help.

Being a starting GFA Basic programmer I'd like to know just what the
GFA Raytrace package is and what it has to offer as a programming tool.
I have GFA Basic 3.5 with compiler and am so far satisfied with that but
would like to know what else is out there.

Thanks,

Thomas

3477. Glendale Conference Impressions

Newsgroup: comp.sys.atari.st
Date: 1991-04-29 20:06:12 UTC
From: plinio@curtiss.seas.ucla.edu
Message-ID: <2610@lee.SEAS.UCLA.EDU>
Source record: 232681

As many of you may have heard, last Saturday (Apr. 27) was the date of a conference for which Bob Brodie flew down from Sunnyvale to chat with and and answer the questions of Southern California Area user group representatives (people from as far as San Diego drove up; to everyones' astonishment, one developer made the drive down from Seattle in one day).

The format of the conference was: John Tarpinian with the introductions and background, Bob Brodie with a 'state of things' talk, a break, and then a question and answer session. After the conference, one of the dealers, TCN of Glendale, set up developer displays inside the (small and crowded) store and people were able to talk to the company reps and try out (and buy) the software.

Most of Brodie's talk concentrated on the dealer network and what Atari is trying to do to strengthen it. He also mentioned management changes and how they are trying to stabilize that by trying to hire only people that already know how to use (and like) Atari computers. He noted his desire to improve the availability of software in the U.S. by sending scouts out at Dusseldorf and Hannover during the big computer trade shows to try to get people to link up with U.S. distributors. Atari is buying the rights to a defunct word processor (wordup? I forget), which they may release under their own label, include bundled on hard disks purchased, etc. Much talk about "retouche", apparently from France. I don't recall exactly what it was for, except that it was graphically oriented and loaded with features that can't be found even on the Mac (sorry about the thinness there). Brodie showed a good sense of humor throughout, and was even willing to make a crack about Leonard. On the whole, it was a pleasant talk, so don't let my criticisms below change that impression.

The question and answer question harvested a few interesting tidbits.

- Inmos H1 processor will be used in the ATW. I thought I heard something about a change in the operating system, but I didn't catch the name. Mach, I hope.
- Factory in Israel is being built because Western Digital would not supply Atari with the controllers it needed, and Atari decided to build its own. Israeli techs reverse engineered the WD1772(?) and the resulting chip can be revved up to higher clock rates to support the higher density floppies.
- Tax problems the reason Atari claims as why it has not finalized plans for a facility in Houston, Texas.
- Atari looking into a 1 GByte 3.5" disk for the TT (next year). No

word on Unix pricing yet (an audience member dogged him until he had to repeat "has not been finalized" a few times). No way to switch between TOS and Unix on the same TT. The techie said that to do so would slow the machine down too much, since they'd have to build an emulator "similar to PC Ditto". This is kind of an unfair comparison, since the processor wouldn't have to be emulated -- all you should need is a toggle for two different ROMS, and a 2-type hard disk partitioning scheme. But they said that the hard disk purchased will determine the (one) operating system.

- Long discussion about the memory system in the TT (I left to move my car -- when I was back, they were still talking about it). You can upgrade the ST memory in the TT to up to 10Meg (total of 23 Meg possible, I think). They were treating it as if no-one would ever need that much memory. Ha! I've already used machines with 32 that didn't have enough (a Unix server).

There were other things mentioned which I forgot, because I didn't bring a notepad or a tape recorder (some people did), but I think these were the main points of interest for the Conference.

Later in the day, at the TCN open house, I was able to ask a GBS representative a couple of questions. He said that the only thing keeping an SST board from being used in a non-Mega ST is the space inside the case. It mounts in a socketed slot where the 68000 usually goes. Those people that already have tower or other large cases should be able to use it. Furthermore, he said there was no word yet on availability. My intuition tells me it should be at least a month before they start shipping -- the rep didn't bring a prototype, so they probably haven't gone to fabrication and are still busy with the (expensive) prototypes.

I also had a chance to ask J. Tarpinian (local user group VIP) about ST sales. He said that they were actually picking up in the U.S. due to their popularity with music dealers and customers. In the LA area, these dealers mention Atari in their radio commercials right next to fast-paced talk about Fender Guitars. Music dealers are also advertising in the print media here, with big, full-page ads.

Well, if anyone else attended, maybe you can fill in some more details.

Date: 1991-04-29 21:16:59 UTC
From: whitcomb@aurs01.UUCP
Message-ID: <59772@aurs01.UUCP>
Source record: 232562

In article <6304@feldspar23.UUCP> dalessio@motcid.UUCP (Mario D'Alessio) writes:
-Does a menu program exist that can be put in the AUTO
-folder on a floppy and show a list of all programs on
-the floppy? I want to be able to boot from a floppy,
-be shown a menu of all programs on the floppy (and
-preferably not list all the data files) and be able
-to select and run the program. It should also be
-able to handle GEM and non-GEM applications.

-Does such a program exist, and where can I get it?

Codehead's HotWire will do most of what you ask. The program
displays a menu of programs that may be executed with a mouse
click or keyboard equivalent. You have to install each
program in the menu individually. The program can be loaded
into the AUTO folder and execute itself (or any other program)
upon bootup.

You can do lots more too. You can call the same program from
several different menu entries and have each entry send a
different command line. You can use the "install application"
option and call any program by clicking on it's associated
document. For instance, you can automatically load a document
into your word processor by clicking on the .TXT file, or
call a picture viewer by clicking on a .NEO file (or whatever)...
and it doesn't have to be in the same folder as the application
(as it does in the TOS install application).

I won't go on to list all the features, but I suggest you check
into it. You should have no trouble finding the program.

-Thanks in advance!

I hope this was helpful.

>post your findings regarding 3.5" SCSI floppies [manufacturer, model #, manual,
>distributors], in order to eliminate redundancy.

Brier Technology, 2363 Bering Drive, San Jose, CA 95131, 408/435-8463 has an entirely magnetic (not optical) drive that puts 20 Mb formatted on a special 3.5" floppy. It can read "IBM formatted floppy disks," whatever that means: 720, 1.44, 2.88? They will soon have one also able to write "IBM formatted floppy disks."

Brier, Sony, Insite and maybe a few others are trying to get a high density floppy standard promulgated.

Don't forget about Laser C. To add to your chart:

Laser C 512K okay; no ~$120US yes
more better

Laser C is a very quick compiler, and generates pretty good code, although I
don't think it's quite as compact as MWC. A pretty good integrated
environment (graphical shell) is included, as are RCS, make, and other
Unix-style utilities. Documentation is generally good.

This is surprising because I thought that someone posted an article stating that the ATW was no longer in production. If the ATW is still alive and will be H1-based, won't the principle market be research-oriented institutions? A detailed description of the H1 was recently posted by an Inmos engineer to comp.sys.transputers, btw.

Some specs of the H1 (T9000) are: two million transistors on a 180 sq.-mm die, 50Mhz, 200 native Mips peak, 50-80 native Mips sustained, operates on up to 40 instructions simultaneously. Expected volume production in mid '92.

>- Factory in Israel is being built because Western Digital would not

This is really puzzling news! If Atari built a factory in Israel, it can't possibly be dedicated to only floppy controller chip production. I may be mistaken, but aren't all those chips becoming extinct because of the proliferation of the SCSI bus in systems and peripherals?

Atari might be better off ordering 10,000 or so SCSI floppies and offering them to Mega STe and TT owners for $100 and their 720K drives. They could also offer older ST systems owners an upgrade which includes a 2.88MB SCSI floppy and a SCSI host adaptor for $200-250. This would standardize all ST owners around the SCSI bus and a relatively-fast, high-capacity floppy drive. I'm not sure, but I think that a SCSI floppy is also able to remap bad sectors of a disk to good sectors so that you probably won't have to throw any disks away.

It seems like a short-term and expensive decision, because many people believe the benefits of the SCSI intelligence would cause manufacturers to leave out the floppy controller chip in future systems.

>- Atari looking into a 1 GByte 3.5" disk for the TT (next year). No
>word on Unix pricing yet...

The TT-Unix combo will probably be too expensive for most people and I wish Atari would license OS/68K from Microware and package it with TT and ST lines.

If Atari can put together a software/hardware bundle with Microware that includ-
CD-I support, this might give TT developers advance info about CD-I, which is
supposed to debut this fall. Then they could program for a couple of dozen
million CD-I users!

>- Long discussion about the memory system in the TT (I left to move
>my car -- when I was back, they were still talking about it). You
>can upgrade the ST memory in the TT to up to 10Meg (total of 23 Meg
>possible, I think). They were treating it as if no-one would
>ever need that much memory. Ha! I've already used machines with 32
>that didn't have enough (a Unix server).

I don't know about the upgrade options on the TT, but does anyone know
if the Mega STe is capable of addressing 16 megabytes? If it supports
the VME A24/D16, then that would be true(?) Could someone check in their
machines and count the number of pins on the Mega STe MMU and compare it
with a ST MMU?

The new Atari User magazines listed the specs the the ST(e) Notebooks and
it stated that there were two 4MB ramcard slots. Along with the max. 4MB
drams and 512KB rom, that adds up to 12.5MB. This means new MMUs (at least
for the Notebook) probably support 24-bit addressing. Does the Mega STe
have this MMU (and the regular STe) too? Could someone please check?

>I also had a chance to ask J. Tarpinian (local user group VIP) about

I noticed the Atari logo on some ads from dealers that previously sold
Amiga and IBM compatibles. It seems that Atari is laying the foundations
for a strong and lasting resurgence. Thanks for the good news!

Sure. The Minnesota Atari ST user group (MAST) BBS carries
comp.sys.atari.st and several other Usenet newsgroups. It runs
STadel software, a version of Citadel, which has supported UUCP
for several years.

The sysop is Tom Cook <tacook@mast.moundst.mn.org>; the BBS phone
number is (612) 472-6582 (300/1200/2400/9600+ Telebit PEP, V.32).

.....plinio.....- Atari looking into a 1 GByte 3.5" disk for the TT (next year). No
word on Unix pricing yet (an audience member dogged him until he had to
repeat "has not been finalized" a few times). No way to switch
between TOS and Unix on the same TT. The techie said that to do so
would slow the machine down too much, since they'd have to build an
emulator "similar to PC Ditto". This is kind of an unfair comparison,
since the processor wouldn't have to be emulated -- all you should need
is a toggle for two different ROMS, and a 2-type hard disk partitioning
scheme. But they said that the hard disk purchased will determine the
(one) operating system.
.....

bob brodie came to our last months users group meeting. I asked him
about unix and he started talking about "at&t version 4" (??). he also
said there was both some kind of hardware problem and a small problem in
the source from at&t.

unix XOR tos? big :-(

>

Why did I say that? Because I was under the impression, after reading the docs in Claus Brod's POOLFIX, that hard drive booters which load before the AUTO folder programs, such as ICDBOOT, would not let POOLFIX3 install itself.

Actually, I was not understanding the entire situation. It's those hard disk drivers which occupy the TRAP #1 vector, since POOLFIX3 takes that vector. Claus rewrote and optimized POOLFIX because his driver takes the TRAP #1 vector as well. (If I'm still not understanding the complete situation, then please let me know. If I should keep my damned mouth shut, then please let me know that too. :^)

Claus Brod's POOLFIX also adds the XBRA algorithm, as well as some other things. The docs that come with his version of POOLFIX explain the improvements much better than I can.

>floppy disks."

This SCSI floppy stuff is getting more complicated! Does the magnetic or optical methods have any intrinsic advantage over the other? When will the drives be available and at what price? If anyone can make a local call to Brier and find out, I'm sure a lot of people would be interested, since about 15 people answered my inquiry for SCSI floppy information.

>Brier, Sony, Insite and maybe a few others are trying to get a high density
>floppy standard promulgated.

Since there will be two VHD drive technologies, won't this turn out to be something like the Beta-VHS dual standards? Usenet might be a good place to take a vote about this, so that we don't end up with a split market.

Keep talking 8-) It's not only my hard disk driver that intercepts
Trap #1 before POOLFIX shows up. There are other hard disk drivers,
and there are also some ROM port or ACSI based network drivers that
have similar problems. Future versions of my hard disk driver will
have a switch telling it to leave Trap #1 alone to avoid such problems.
A network driver, however, must occupy Trap #1 to implement network
services - there's no choice. So that's why I tried to improve
POOLFIX.

When talking about my version of POOLFIX, please refer to it as
PFIX_CB, _not_ POOLFIX4. And please don't bother Atari if there's
trouble with my POOLFIX version - it's all my own silly fault.

When the local(an hour and a half away) Atari store received their 1st
shipments of TT's they had the new keyboard, however, the 2nd shipment had the
old style. All 6 of them were shipped with it. A quick call to Atari told us
that they had run out of TT style keyboards and were shipping the old MEGA
keyboard until they could get more. Anyone who got the old keyboard could
upgrade to Atari FREE OF CHARGE! This is not FALSE information, as you say, I
was there when they opened the boxes, I was there when they called Atari.

I believe to uudecode one file into multi-parts, you have to use the -x
(where x is the no. of lines that you want in the uue file). To UUE, say
for instance, a 100K file called DUMMY.LZH, on the command line, type:
-700 DUMMY.LZH. This will create a series of uuencoded files that are 700
lines long (except for the last file, which will be the remainder, but not
necessarily 700 lines long).

Prospero C also implements ANSI C, which like all Prospero languages work
on other systems (tested with C, Pascal, Fortran on a VAX) when you're re-
stricting yourself to the standards.
Additional features: GEM integrated, library manager, mixed language support
(important for numerical algorithms using Fortran libs),
good documentation
optional features: cheap coprocessor libraries available (so you can build
3 versions of a program), developers toolkit available
(with some minor goodies like a command shell and a
Make-utility)

3506. static globals?

Newsgroup: comp.sys.atari.st
Date: 1991-04-30 18:30:34 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Apr30.183034.15773@lsuc.on.ca>
Source record: 232567

I've been working at a port of Rodney Volz' Mercury and there's a fair bit of strangeness in some of the sources. In the 'elm.c' module I have had some strange problems with the Sozobon C TOP optimizer. I think that this is not critical, but I decided to look for problems in the source code. One thing I've found is that he declared a bunch of variables globally and made them "static". This didn't seem to be a problem for the compiler, but I #ifdef'd them out and replaced them with non-"static" declarations.

I've never seen this type of declaration before. Why would you bother to declare a "global" as a "static"? Is there any point to it? It doesn't seem to be a problem for the compilers to handle.

Turbo-C should work with 512k but works quite well with 4meg :-) I use
it with a Mega4/Ste (as does Gregory). The "Pro" package sells for
around US $275, details:
o Memory: .5 or more meg RAM.
o Latest version is 2.0[1] (I think).
o Source level debugger.
o CPP type preprocessor.
o Assembler.
o Full GEM/AES/VDI libs, floating copro libs, Borland graphics libs,
BCD libs?.
o Integrated development environment just like PC's (ie editor, one
button compile, link, [run]). Really fast.
o Docs in German of course - I "hear" this is changing but we'll see.

I use it from the command line, with a shell (currently Gulam, Master real
soon now), Emacs, and Gnu Make. Very versatile environment.

Look for Borland C++ sooner or later - The rumor line says this is hot!

3509. C compilers (was Re: C)

Newsgroup: comp.sys.atari.st
Date: 1991-04-30 19:30:21 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991Apr30.193021.10443@newcastle.ac.uk>
Source record: 232587

There is also the question of ANSI compatibility. So Here is my revamped table.

```
name memory src price ANSI Debuger Notes
-------------------------------------------------------------------------
GNU C 2Meg+ yes nil Y poor for ST UNIX origins
Sozobon C 520K yes nil N none?? PD
MW C 520K no #110 N Src Level No longer updated
Prospero C 520K no #100 Y Src Level Links to other Prospro langs
Turbo C ?? no ?? Y Src Level Only in german
Lattice V5 R 1Meg+ no #110 Y Low Level Optomiser
Laser C R 1Meg+ no #100 N Src Level Very fast compile times
-------------------------------------------------------------------------
```

Notes: Prospro C links with other Prospro product because it uses the GST format and not a propriety format. Some other compiler may offer GST link format also (I know Lattice C offers both GST and Lattice libraries.)

The R in the memory section indicates that 1meg of memory is recomended but the compiler can be run in 520K.

Prices are in pounds sterling and are very approximate mail order prices.

I think that covers all the C compilers I know of with the exception of Alcoyn C which is very dated and Hisoft C interpreter (not a compiler and only offers a subset of K&R C).

Corrections to the above always welcome.

As a recomendation I would say the following if you have lots of memory, hard disk and no need for commercial support or documentation go for GNU C. If on a budget and have a less powerfull setup Sozobon should serve you well. If good profesional support is your prime thought I would recomend Prospro C. Turbo C is good if you read german. If executable efficiency is your prime criteria then Lattice C can't be beeten (though Turbo C is close). Finally if compile speed is required then Laser C is the best bet (I'ts one pass compiler compiles at an order of magnatude faster than many of the other compilers.)

So each compiler has its strengths.

For those wondering what my bias is I own GNU C and Lattice C Vsn5.

3510. TT questions

Newsgroup: comp.sys.atari.st
Date: 1991-04-30 19:41:10 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991Apr30.194110.10662@newcastle.ac.uk>
Source record: 232586

Is it realy true that the TT can only run Unix OR TOS but not both. I do not meen that they should run Unix and TOS at the same time but be bootable between the two different OS's.

Here at this University we have a set of Acorn R260 Achemedies that useually run the acorn OS but have been configured to boot X and Unix whilst still allowing a boot back to Achemedies mode. This seems much more sensible.

3511. ATW on educational discount.

Newsgroup: comp.sys.atari.st
Date: 1991-04-30 19:45:30 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991Apr30.194530.10744@newcastle.ac.uk>
Source record: 232585

An interesting fact is that the ATW is discounted by 50% to education here in the UK. That places the ATW at 2500pounds rather than 5000pounds and thus only just above the price of the TT. The thing is that there is still only a few software packages for it.

Dave H.
(D.C.Halliday@newcastle.ac.uk)

3512. Tape Streamers

Newsgroup: comp.sys.atari.st
Date: 1991-04-30 19:53:38 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991Apr30.195338.10946@newcastle.ac.uk>
Source record: 232589

I am interested in adding a tape streamer to my system. I would require a SCSI steamer and software. My questions are can anybody give me some model numbers of SCSI tape streamers and a pointer to some software. A while back I remember that someone had written a UNIX tar compatible program for the ST that could tar the files to and from UNIX compatible tapes this would be just great.

Dave H.
(D.C.Halliday@newcastle.ac.uk)

3513. Mega STe Questions.

Newsgroup: comp.sys.atari.st
Date: 1991-04-30 20:20:27 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991Apr30.202027.11364@newcastle.ac.uk>
Source record: 232590

Does anybody out there know if the Mega STe 1 (the one without the HD) has the ASCI-SCSI adapter installed. Can the atari SCSI adapter handle more than one device (I am used to ICD's). Also is there a mounting bracket installed ready for a HD. Finally what is the driver software like?

Another Mega STe question is, does it have a TV output or only monitor output?

Dave H.
(D.C.Halliday@newcastle.ac.uk)

3514. uudecoding multi-part files?

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 00:00:03 UTC
From: alten@hpcvia.CV.HP.COM
Message-ID: <56360001@hpcvia.CV.HP.COM>
Source record: 232654

Can anyone please explain the requirements for file names in order to uudecode a multi-part file? I seem to recall something like the file names must be sequentially named file.uaa, file.uab file.uac etc. Also it seemed that the ----end---- line of the file had to have some notation in it. Please clarify my misunderstandings.

From: marshall@cs.uq.oz.au
Message-ID: <1083@uqcspe.cs.uq.oz.au>
Source record: 232594

I am very confused! Looking at atari.archive I found lots of stuff relating
to TeX.
As a TeX ignoramus, I don't know what the latest stuff is.
I would like to run Latex on my 1040ST (TOS1.0), 1MB,mono , and also preview the
files. I don't necessarily need to print locally.
I remember someone saying there was something for the St similar to fig. Is
that at atari.archive?
Also, someone said stuff can be downloaded from forwiss.uni.-passau.de
What is the numeric address, please?

>it? It doesn't seem to be a problem for the compilers to handle.

Technically, only static variables are guaranteed to be automatically
initialized to zeros. Also, I think that only _static_ globals can be
given initializers, although most compilers seem to accept initialized
auto globals as well. That may be an extension, however.

>it? It doesn't seem to be a problem for the compilers to handle.

Oops, I forgot one crucial point in my previous message. If you
declare a global variable as "static" then it will not be exported out
of the .o file it appears in. So static vs. auto makes a difference
with respect to separate compilation. The static storage class is
very useful for avoiding name clashes between modules.

If you're not using separate compilation; i.e., if you have one
giant .c file or #include everything all at once, then static
vs. auto makes little difference for globals.

Dave Baggett
dmb%wam.umd.edu@uunet.uu.net

3519. Virus Protector

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 02:08:56 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.90.2.673063736.larserio@kvart.ifi.uio.no>
Source record: 232600

As I do not have access to that many atari-archives I will post
this short (?) review of my newest program here and hope that some
og you will contact me and get the file and spread it for me....

Protect6 - Your way of protecting your system against viruses
"""

Protect6 is a small but powerful program that is resident in RAM
looking for bootsector and link-viruses. It's easy to install
(just put it in the AUTO-folder on your boot disk) and easy to use.
Before you install it you should read this documentation and learn
to know the different messages, warning and questions you might get.
The program is tested, but you are using it at your own risk anyway.

Bootsector-viruses
""""""""""""""""""

Each time the system detect a new disk in drive A: Protect6 will
check this disk to see if it contains a bootsector-virus.

If the disk is allready immunized or if it is a MS-DOS disk you
won't notice anything, BUT if the disk IS auto-booting you will
get this message in the upper left corner of the screen:

Disk is Auto-Booting, Should I kill it ?
<here is the contents of the bootsector>
Call ABK-BBS +47 2 132659, 1200-9600 BPS

In the middle line the contents of the bootsector will scroll
by giving you a chance to decide if it's a virus or another
type of auto-boot (it could be an auto-starting game etc...)

If you decide to KILL and IMMUNIZE the disk press Y for YES,
if you DON'T want to CHANGE the bootsector press N for NO.

If you decided to kill the disk or if Protect6 find a disk that
is not auto-booting, but isn't immunized either, it will try to
immunize the disk and you will see this message on the screen:

Killing and Protecting disk in drive A:

If everything went well the message will dissappear and the screen
will be redrawn and control returned to the active program/desktop.

If the disk in A: is write-protected you will get this message:

Disk is Write-Protected, Try once more ?

If you still want to KILL and IMMUNIZE the disk you should REMOVE
the WRITE-PROTECT tab and press Y for YES, if you have changed your

mind and want to KEEP the DISK as it is just press N for NO.

All disks immunized by Protect6 are auto-booting and readable on
MS-DOS and PC-DOS systemes (IBM's) and contain an info-text.

Link-viruses
"""""""""""""
This is a very nasty kind of virus that contaminates program files
and spreads like fire on harddisks. Protect6 hooks on to the OS-
routines and gives an alert if a program tries to modify another
program (this is the way all known link-viruses spread):

Program is trying to modify FILENAME.PRG
Any key to modify file, Reset to Abort !
Call ABK-BBS +47 2 132659, 1200-9600 BPS

FILENAME.PRG is replaced by the name of the program that will be
modified. If this is OK just press ANY KEY (some programs store
their configuration data this way), BUT if the program currently
running is NOT supposed to MODIFY the indicated file you should
write down the name of the program running and press RESET.

When the system has rebooted you should examine and if possible
remove the program that tried to modify another program. If you
have an older (hopefully non-contaminated) backup you should copy
this on to the disk and see if the problem dissappear.

>
>This is surprising because I thought that someone posted an article stating
>that the ATW was no longer in production. If the ATW is still alive and will
>be H1-based, won't the principle market be research-oriented institutions?

As a matter of fact, that's exactly what Brodie mentioned -- that it was intended mainly for people that were going to write their own software anyway. Institutional or Corporate Research. This was the case with Eastman-Kodak. They bought the ATW hardware for a specific purpose and then said "get out of our way!" (software wise). I don't know whether the ATW is in production or not. Probably doesn't matter, because the demand seems to be for only a very few units.

>This is really puzzling news! If Atari built a factory in Israel, it can't
>possibly be dedicated to only floppy controller chip production. I may be

Sorry to have implied that. I don't know if it will be dedicated to that sole purpose. That's all that Bob mentioned about it, though.

>Atari might be better off ordering 10,000 or so SCSI floppies and offering them

I agree, WD and plants in Israel may go away (Scud? :-)), but SCSI is here to stay (well, at least SCSI-2 is).

However, I think that if the 20.8M 3.5" drives read 720K and 1.44 Meg floppies, Atari should skip the whole lot and offer that instead. If, as you mention, everyone had this standardized quasi-harddisk capability, new software writers wouldn't be pressed to fit everything into a few disks, lowering development time and keeping the cost of good software low. It would raise the cost of small software, until the 21M floppies come down in price, but it would simplify backups without requiring the purchase of a tape drive. Would I go so far as to say, skip the 20.8's and go on to Syquest? I can't stick those things in a shirt pocket, or in a folder, for that matter. IMHO, 5.25" is a step backwards.

Also, I haven't seen a Syquest mechanism for less than $585; to add $500 to entry-level machines is really pushing the startup cost. To add $300 and kill two birds with one stone (720K compatibility + real storage) seems the better solution.

>It seems like a short-term and expensive decision, because many people believe
>the benefits of the SCSI intelligence would cause manufacturers to leave out the
>floppy controller chip in future systems.

I think Atari has an (unfounded?) fear of disk incompatibility with
the current base of software. True, the last thing they need is for
the software base to be shrinking. If they maintain the same controller
for 720K-2.8M, they probably think it will be easier to solve
any compatibility problems. Yes, it seems like building a new plant is
more of a risk than using a (possibly?) incompatible 20.8M drive.
However, if EC turns into "Fortress Europe", and Atari is caught
without a more local plant by 1992, they could see their primary
market disappear... Also, does selling duty-free to Europe mean they
can get around the 15% Value Added Tax (ouch)?

>I noticed the Atari logo on some ads from dealers that previously sold
>Amiga and IBM compatibles. It seems that Atari is laying the foundations
>for a strong and lasting resurgence. Thanks for the good news!

For the most part, it looks like they are making more of the "right"
decisions.

I've heard that the MegaSTe1s released in Canada don't have the host adapter installed. Moreover, the mounting holes and brackets have been removed. Finally, (more bad news) from what I understand, there are posts installed, seemingly to PREVENT a hard drive being installed. The top of the hard drive case isn't the same either; it's not as easy to get into it as the other MegaSTes and TTs. I think I read this on Fidonet.

The MegaSTes have only monitor output.

If someone knows more about the MegaSTe1 situation, please share it with us.

I think you mean DigiComposer. DigiSound is a commercial sound sampler.

IMHO, DigiComposer must have the worst sound of any of the Noisetracker
module players. I think the recently posted TRACKSTE.LZH has much
preferable output, and it can load mods from a hard drive. Unfortunately,
it doesn't have the nifty, multicolored spectrum analyser like others do,
but it still has some nice features.

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can

appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT"
in the newsgroup rec.games.video for more details, including information
on how to vote.

Questions, comments, problems, and errors should be directed to the list
maintainer at either of the below addresses:

3525. VIDEO GAME RATINGS BALLOT [ATARI]

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 06:20:23 UTC
From: erc@radon.berkeley.edu
Message-ID: <41995@ucbvax.BERKELEY.EDU>
Source record: 232662
Cross-posted to: rec.games.video,rec.games.misc,comp.sys.atari.st

To use this ballot, just hit "R". Once in your editor, insert your game rating between the word "vote" and the system code and game title. Your rating must be an integer between 1 and 10. There must be at least one blank on either side of your rating. Make sure the word vote appears at the start of each rating.

If you do not want to rate a particular game, just DELETE THAT LINE FROM THE BALLOT. When you are finished, SAVE THE FILE, and exit the editor. The votes will be sent to the game rating tabulator.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

If you want to vote for additional games, just add them at the end, in a format similar to the existing entries. Be sure to include the system code right before the title. This code is one of the below:

AL = Atari Lynx AM = Commodore Amiga
GB = Nintendo Game Boy GG = Sega Game Gear
GS = Apple II GS MA = Apple Macintosh
NE = Nintendo NES and Famicom NG = SNK NeoGeo
PC = IBM PC, PS/2, and compatibles SG = Sega Genesis and MegaDrive
SF = Nintendo Super Famicom ST = Atari ST
TG = NEC TurboGrafx-16, TurboExpress,
and PC Engine

Thanks for participating in the rec.games.video ratings poll. (This text was adapted from Chuck Musciano's rec.arts.movies ballots and John Leo's rec.games.video ballots.)

PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.
PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.
PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.

3526. Atari buys Word Up??

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 06:47:14 UTC
From: terry@vax1.mankato.msus.edu
Message-ID: <1991May1.004715.518@vax1.mankato.msus.edu>
Source record: 232673

I've read something about Atari thinking about buying WordUp form distributions and updates in STart magazine. Is there any new news on this?

3527. Comparisons with Mac's Stepping Out II

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 06:54:12 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1991May01.065412.27026@ecst.csuchico.edu>
Source record: 232670

Has anyone seen Stepping Out II for the Mac? It's a program like
BigScreen and MonSTEr on the ST, which creates a virtual screen
larger than your actual screen, and then you can scroll around it
using the mouse. Anyone know if there's a program like it on the ST,
where you can shrink the virtual screen and see it all at once?
(Anyone even know how that's done, and if it can be done on the ST?)

I think Stepping Out II goes to 2048x2048. Does anyone or would
anyone ever use this size resolution? Hey, how about 4096x4096?

3528. Mega STE problem (?)

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 06:54:23 UTC
From: hohr@cernvax.cern.ch
Message-ID: <5114@cernvax.cern.ch>
Source record: 232669

Hi netters,

A few time ago (January '91), I wrote a .PRG that allows screen dumps on 24 pin printers, thus using the usual Alt-Help keys. This was is the good ol' days... on my Mega ST1 (running TOS 1.2).

But this .PGR refuses to work on my brand new Mega STE/4.

I fixed it by using Gemdos calls instead of BIOS calls. Of course, it's slower now.

So here's my question:
- Why, under supervisor mode, will TOS 2.05 not execute Bcostat(0) nor Bconout(0,c)?

Thanks for you reply.

Roger hohr@cernvax.cern.ch

3529. Re: uudecoding multi-part files?

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 07:27:49 UTC
From: REEVES@SLACVM.SLAC.STANFORD.EDU
Message-ID: <91120.232749REEVES@SLACVM.SLAC.STANFORD.EDU>
Source record: 232666

In article <56360001@hpcvia.CV.HP.COM>, alten@hpcvia.CV.HP.COM (John_Altendorf) says:
>
>Can anyone please explain the requirements for file names in order to
>uudecode a multi-part file? I seem to recall something like the file
>names must be sequentially named file.uaa, file.uab file.uac etc. Also
>it seemed that the ----end---- line of the file had to have some notation
>in it. Please clarify my misunderstandings.
>

The files do not need to sequentially named, at least not with the DUMAS UUX utilities that I use. If you look at the files, there is a line at the bottom pointing to the next file. However, the sequential naming is still useful. You won't be as easily confused as to what the file is.

3530. Re: Comparisons with Mac's Stepping Out II

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 08:17:14 UTC
From: kawakami@cyclone.Berkeley.EDU
Message-ID: <42008@ucbvax.BERKELEY.EDU>
Source record: 232671

I think that the next writer of a Bigscreen like program should incorporate a "proportional pointer" (my term) like the mac CloseView program. The position of the pointer on the screen reflects the relative position of the pointer on the virtual screen. So as you move toward the desk menu the pointer moves to the upper left corner of the CRT. As you deal with the File Selector, the pointer roves around the center of the screen. If you do something in the upper right corner of the virtual screen, the pointer is in the upper right part of the screen.

3531. NovaNet

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 09:40:48 UTC
From: cliu@jarthur.claremont.edu
Message-ID: <11966@jarthur.Claremont.EDU>
Source record: 232575

Hi.

Pardon the vagueness of this question.....

Has anyone heard of a terminal emulation program called NovaNet?
Apparently it comes out of U of Illinois, and is used to link to
some type of graphically oriented computer system. Any info would
be great (like... what is it exactly??). Seems there are versions
of it for MS-DOS, Mac, and maybe Amiga. Is there an ST version?

Much thanks!

3532. fitting a hard disk

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 13:02:15 UTC
From: J.A.Jones@lut.ac.uk
Message-ID: <1991May01.130215.24648@lut.ac.uk>
Source record: 232680
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm posting this for a friend who has no access to the news or
mail. I will pass on any replies.

Hello there

I have and Atari STE and want to attach a hard disk to it. I
have also been given a surplus hard disk by my employers. The hard disk
is marked

"RODIME R0351 type 2"

Is there any way I can attach this disk to the machine directly ?, via a
controller of some sort ?, which controller type ?, where can I get one
from (In the UK) ?. If this disk isn't suitable can anybody suggest a
(cheap,reliable) type that is and tell me what I need to do to attach it
to the machine.

Rather a lot of questions I know but I am *DESPERATE* for a hard disk.

Please bear in mind that I am not very technically minded and am
relatively new to computing and computers. Please can you reply to my
friend at j.a.jones@lut.ac.uk .

Cheers
Steve

Is this version of Turbo C available in the UK? Borland only seem to
know about the PC versions of their products. Does it look and feel
like the PC version?

Nobody's mentioned Lattice C (v5) yet ... I suppose thats just as well!

3535. TT030 and Mac Emulation...

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 15:18:39 UTC
From: sander@engin.umich.edu
Message-ID: <1991May1.151839.5575@engin.umich.edu>
Source record: 232675

Yes, due to some timely advice and comparison's sent to me (thank you all who replied) I have decided that the corporation shall buy a TT030.

A few questions: How does one go about Mac emulation? Someone had mentioned that this was an available product (unfortunately i deleted the msg. :( ). I cannot remember the acronym. Is the product a board, a program, or both? Price? Compatibility with all Mac programs? Would I for instance br able to write a memo on the TT using MS-Word or some Mac program, then take the disk it was saved on to a Mac somewhere to use the Laser Writer?

I have just started reading these newsgroups in the past week or so, so a few uneducated questions: UNIX on an Atari? how does this work, and is it a viable thing to do? I have used UNIX extensively, and would like it on the Atari...

Desk Accessories: How do these work, where can I get them, and so forth...

I also need info on telecommunications: terminal emulators with Kermit or some likewise transfer protocol. I would appreciate some comparison's if someone has the info handy...

I would also appreciate any comments that can be made on what people consider to be the most useful additions to their Atari's. The applications that would especially interest me are a) MIDI all and sundry, b) C programming c) graphics programming (virtual reality, photo-quality picture generation, etc)

Please keep in mind that this is a small company we are talking about here; no $800 software can be afforded :) but some reasonable stuff can...

Please email replies, unless you feel the info would be useful to someone other than myself as well...

Thanks in advance,

Scott Anderson...

3536. Nethack problems

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 15:35:11 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <6237@vela.acs.oakland.edu>
Source record: 232678

I just downloaded the latest version of nethack from atari.archive...
and I got the thing all set up, but the keys seem to be all messed up.
The thing prompts me for save file, and I have to hit ^H to get a return
character. Anyone run into this or know of a fix?

I got version 3.0 and I am running it on a 520stfm with 1 M (2 drives)

thanks

swood

Pity. I would really like to know more about the reason everything
has to start from zero.

From: CHT510@SATURN.UKC.AC.UK
Message-ID: <9105011743.AA12592@lilac.berkeley.edu>
Source record: 232683

Could anyone give me the approx price of Spectre GCR and maybe a US supplier tht would ship internationally.
In the UK the price seems to be about 290 pounds (approx $550) and thats *without* the Mac ROMs.
I'm sure that I've seen a price on the net somewhere before that was way below that.

thanks in advance.

Adam Whitham.

`In article <12733@uhccux.uhcc.Hawaii.Edu> kiki@uhunix1.uhcc.Hawaii.Edu (Jack W. Wine) writes:
`>First of all, thanks for the interesting report!
`No prob.
`
`>>plinio@curtiss.seas.ucla.edu (Plinio Barbeito/) writes:
`>This is really puzzling news! If Atari built a factory in Israel, it can't
`>possibly be dedicated to only floppy controller chip production. I may be
`
`Sorry to have implied that. I don't know if it will be dedicated to
`that sole purpose. That's all that Bob mentioned about it, though.

I didn't think he said it would be a factory. Sounded to me like they had
hired people to reverse engineer the WD1772 and do a layout for one that
would run faster.

`>Atari might be better off ordering 10,000 or so SCSI floppies and offering them
`
`I agree, WD and plants in Israel may go away (Scud? :-)), but SCSI is
`here to stay (well, at least SCSI-2 is).
`
`However, I think that if the 20.8M 3.5" drives read 720K and 1.44 Meg
`floppies, Atari should skip the whole lot and offer that instead.
`If, as you mention, everyone had this standardized quasi-harddisk
`capability, new software writers wouldn't be pressed to fit everything
`into a few disks, lowering development time and keeping the cost of good
`software low. It would raise the cost of small software, until the
`21M floppies come down in price, but it would simplify backups without
`requiring the purchase of a tape drive. Would I go so far as to say,
`skip the 20.8's and go on to Syquest? I can't stick those things in a
`shirt pocket, or in a folder, for that matter. IMHO, 5.25" is a step
`backwards.

Well, it would do more than that. As Bob mentioned, parts of GEMDOS (BIOS
and/or XBIOS?) are closely wed to that controller. If they used a new
controller, it would be very difficult to make it appear to be the WD1772,
and software that talks to the contorller would also fail.

`>It seems like a short-term and expensive decision, because many people believe
`>the benefits of the SCSI intelligence would cause manufacturers to leave out the
`>floppy controller chip in future systems.
`
`I think Atari has an (unfounded?) fear of disk incompatibility with
`the current base of software. True, the last thing they need is for

`the software base to be shrinking. If they maintain the same controller
`for 720K-2.8M, they probably think it will be easier to solve
`any compatibility problems. Yes, it seems like building a new plant is
`more of a risk than using a (possibly?) incompatible 20.8M drive.
`However, if EC turns into "Fortress Europe", and Atari is caught
`without a more local plant by 1992, they could see their primary
`market disappear... Also, does selling duty-free to Europe mean they
`can get around the 15% Value Added Tax (ouch)?
`

Another problem is that Western Digital told ATari that there would no longer be a WD1772. What do you put in 1040STEs? SCSI floppies would be awfully expensive for a low-end machine.

>on a SCSI-to-ACSI converter, why include the logic to talk to an arbitrary
>SCSI device number? It would mean logic in the adaptor to see what SCSI
>drives are out there.

No, both the Supra and the ICD will allow for the absence of a SCSI device
number 0 (ie they both support muliple devices).

>As for the ST/TT side of the bus, you have to start with zero on each bus
>and increment by one for each drive you connect to that bus. (Remember,
>that's unit numbers as the computer sees them, not as the adaptor sees the
>disk it's actually talking to.) The reasons for this are kind of involved,
>and I don't want to go into them; just take my word for it and carry on.
>

The reasons for this have always been the exact question which I have been
asking. At this point, an explination does not interest me. However, I
do think it would be rather nice if a paragraph or two was included in the
TT manual explaining this phenomena, and how to correct it with a few of
the major brands of host adaptors. The DMA port on the back of the TT
is handled differently than that on the various ST's, and this could cause

an hard drive set up (and working) on an ST to fail (with very little
explanation from the Atari HD software).

>I have even heard of some adaptors which look at the SCSI unit number of
>the drive that's connected, and configure themselves as that ACSI unit
>number, further confusing the issue.
>

This is very likely the reason why the drive did not work. Since the
SCSI disk was set to ID 1, perhaps it set the ASCI number to the same
(thus confusing the Atari HD software). It would be interesting to
see if the BMS and ICD host adaptors create the same problem.

>Eric A. HOBBS!
>eahsnsr@JUPITER.nmt.edu

Granted this should be brought up in rec.games.video but.....

The NEO-GEO is a cartridge based game system that has some
outstanding features.

15 channel digital sound (7 channels reserved for voice)
....not sure if its 16 or 32 bit system

the carts are now on average 50 megs EACH!!! and can hold up to
330 MEGS!!

The carts are about the size of a VHS tape.
The pricing mentioned in the previous post is correct.

You can also use memory cards....

Play a game at your local arcade, save it out on the card,
bring the card home and load up where you left off! (vice-versa
also true) the arcade units also have headphone ports on the lower front
of the machine.

Please refer all future replies and questions to rec.games.video

From: Lutz_Frank@ac2.maus.de
Message-ID: <4627@ac2.maus.de>
Source record: 232515

Hi Jeffery,

jd> Atari Megafile 30 in partition D have become invisible. The problem
jd> started when I was using Cheetah to copy some files from logical drive E
jd> to D. For one copy it either said that it couldn't find the drive path

I got the same problem using CHEETAH on BGM-partitions of my harddisk.
There I could only save one of the BGM-partitions. Cheetah destroyed the
root sector of the destination hard disk.
If you have a monitor like DISKUS you can try to restore the root-sector.
(I didn't have had this programm at this time - I lost all since last
backup ... ;-( ). Now I have a collection of copies of my root sectors on
a special disk - just for case of emergency ...

Kind regards
Lutz

3547. Advantages of Improved Mice?

Newsgroup: comp.sys.atari.st
Date: 1991-05-01 20:49:50 UTC
From: glennd@athena.arc.nasa.gov
Message-ID: <1991May1.204950.6749@riacs.edu>
Source record: 232699

I recently heard from someone who said that using an improved mouse (improved over the standard Atari mouse, that is) significantly improved the performance of his GEM windows - if I understood him right. That is to say, that windows would raise faster, grab the focus faster, etc. just by using an improved mouse - so that GEM would like it was significantly speeded up. He said he used a "Golden Image" mouse. Do others that have bought better mice notice anything like this? If so, it would certainly seem like a worthwile investment.

Thanks.
- Glenn
Also, recommendations on better mice?

You can't. At least not from here. I posted about two weeks ago stating
that I knew there is a corrupt file, and i'm working to correct that.
Roy has been sending me versions for the past two weeks in an attempt to
find a method that works. Currently, we're waiting for his
machine to get it's internet connection.

If anyone has a working copy of gcc-cc1.ttp that they could send to me,
please do so as soon as you can.

When (if) we get a working copy, I'll leave just an archive of gcc-cc1.ttp
so that everyone woon't have to d'l it all over again.

I seriously doubt that GEM would perform faster because of a better mouse.
However, you would be able to use it faster. A better mouse responds more
quickly to your movements and clicks. The Golden Image is supposed to be
very good, a lot like the Microsoft Mouse for DOS machines. I've tried
the Beetle mouse, and it's also very nice. I'm one of the lucky few.
I've got a really good Atari mouse.

Source record: 232604
Cross-posted to: comp.sys.atari.st,misc.forsale

For sale: Spectre/128 Macintosh emulator for Atari ST.

Note: * For sale as a complete package only *

Includes:

Spectre 128 cartridge (of course!)
Apple 128K ROMS (the real ones, getting hard to find)
Spectre software version 2.65 and version 1.9F
You need 1.9F to use the Translator/One for reading/writing/formatting
Mac readable/writable floppies. 2.65 is the next version, which does
not have support for the translator. Version 3.0 (the current version)
is a $20 upgrade, but I didn't get it, since it has no Translator
support built in.
Manual (for version 2.65)
Various "Gadgets by Small" newletters.
Translator/One w/power supply and cables
Comes with a power pack, 2 Midi cables, and a drive cable.

Price: $250 plus shipping.

I'm reachable via email at: jfbruno@rodan.acs.syr.edu

Date: 1991-05-02 00:41:41 UTC
From: pyr579@oz.plymouth.edu
Message-ID: <1991May2.004141.24732@oz.plymouth.edu>
Source record: 232608

Hello,

I just purchased a monochrome monitor and have suddenly been unable
to use my Timeworks DTP program. I have a 1040STf, and am running DTP on
drive D: of my hard drive. I also use Neodesk (2.05 soon to be 3.0) and
Super Boot 7.0. I know it has to been reinstalled to switch to mono and I
did so. But FontWid.APP crashes while writing font widths and the PUBLISH.APP
program crashes on bootup saying "unable to load screen fonts". Anyone else
run into this? I only want to use it on my mono monitor now that I have one,
but am puzzled as to why it doesn't work.

Thanks,

Stephan

3559. CodeHead Software Util.s

Newsgroup: comp.sys.atari.st
Date: 1991-05-02 02:25:16 UTC
From: Dave_Ninjajr_Flory@cup.portal.com
Message-ID: <41916@cup.portal.com>
Source record: 232656

Just happened to realize that I can't remember ever seeing a reference to any of the CodeHead Software utilities here on Usenet. They are commercial but in my opinion the comprise the finest utility software available for ST/TT line. For a long time I have used Norton Utilities on the IBM and the Mac and have gained a lot of respect for these products of Peter Norton. The CodeHead stuff has been close, but the latest update of Maxifle has forged ahead and is now better than either version of Pete's work. Maxifile III combines elements of IBM and Mac versions, with toggleable source and destination windows, filters, fastfind withe a function key running your choice of the found files. Automatic viewing of text files, etc.

When you combine this with CoKeys macros, Little Green File selector, and MultiDesk, you have a whole system that has kept me from seeing the desktop for a LONG time. The more you know the more useful these utls get, with command lines and abilitiy to chain files and programs, install apps, have global menu items in Hotwire which are maintained the same while the rest of the menu changes, etc., etc. This is _good_ software, at a reasonable price, with _outstanding_ developer support, aftersale.

No I have connection with them except to think that C.F.Johnson and John Eidsvoog are great guys, and I love their software.

>Sozobon C 520K yes nil N none?? PD

I have source files from the '...st.sources' newsgroup that
are supposed to be a source debugger for Sozobon C. I haven't
even unpacked it yet though so I can't say more than that.

Also Sozobon is NOT Public Domain. It's currently "Free".
There's no guarantee that any or all future versions will
also be free. Personally, I'm hoping they make at least one
more free distribution which will be the definitive cleaned-up
official version. After that, I don't care if they go "commercial".
But I think they sort of owe it to the people who have helped
them "beta test" this compiler.

>Lattice V5 R 1Meg+ no #110 Y Low Level Optomiser

I'm thinking about buying a Lattice. I'm working with
a 1040ST, and when you have a bunch of ACC's loaded, I'm wondering
if I'll might have a problem. It is really that touchy about
RAM?

>So each compiler has its strengths.

Many thanks to all who have replied to my query! After
reading this message I remembered all about "static globals".
Ironically, I learned it years ago and forgot about it a couple
of years ago and asked exactly the same question at that time.
Then I remembered when someone else answered. So here I am
about 2 years later asking it all over again. Truth is, I'll
probably forget and have to ask again in another couple of years.
Gads. No hope for me at all. :-)

Jerry Pournelle got his hands on a TT and gave it a pretty good review. He must have a soft spot for Atari from the days of the 400/800, since, when he tested the A3000 he was somewhat less charitable. :-)

In a related note, Atari Interface Magazine published the letter and reply from Byte regarding Atari coverage in the magazine. Basically, Atarians want more coverage and Byte says there are not enough Atari users out there. This letter circulated around c.s.a.t a while back.

>like?

I doubt anyone in the US has seen a Mega STe 1 yet, but the reports on
the F-Net feeds are that Atari has purposely crippled the system (similar
to the way they crippled the Mega ST2) to prevent upgrading it.

The pc board is cut off where the host adapter would be, and the plastic
case has been redesigned to prevent intalling a hard drive mechanism.

Can anyone from Canada or Europe who's seen this model either confirm
or deny these reports..?

FOR IMMEDIATE RELEASE -- April 28, 1991

Ann Arbor, MI/Windsor, Ontario, Canada -- The Windsor Atari Users Group of Windsor, Ontario, Canada and the Washtenaw Atari Users Group of Ann Arbor, MI are hosting the Windsor/Detroit International AtariFest on May 4-5, 1991 at the St. Clair College of Arts and Technology in Windsor. Don't miss this show -- it's a BIG one!!!

Exhibitors attending the show include:

Atari US Atari Canada Branch Always Software
Canoe Computer Channel One Computer C-HQ, Inc.
Clear Thinking CodeHead Software Computer Services & Supply
Computers Plus Consortium Software DA Brumleve
DataQue Software Double Click Software Gadgets By Small
Gribnif Software Goldleaf Publishing ICD, Inc.
Intrinsic Software ISD Marketing JMG CompuShoppe
JMG Software MegaType Micro Creations
MS Designs Musicode Software Nice & Software
PDC Distributors Phil Comeau Software Rimik Enterprises
Sav-Tech SKWare One Taylor Ridge Books
Unicorn Publications What's This? Wiz Works

Seminars!

Seminars will be held throughout both days by companies such as Branch Always, CodeHead Software, DataQue Software, Gadgets By Small, Gribnif Software, Goldleaf Publishing and ISD Marketing to name just a few! Jeoff Earle, general manager of Atari Canada and Bob Brodie, manager of User Group Services for Atari US will hold a joint seminar on each day as well.

Windsor/Detroit International AtariFest
Seminar Schedule

Time	Saturday	Sunday
10:45	Atari Users Association	DataQue Software
11:30	JMG Software	Rimik Enterprises
12:15	Branch Always Software	Gadgets By Small
1:00	Atari Canada and US	Goldleaf Publishing
1:45	DataQue Software	CodeHead Software
2:30	Gribnif Software	Atari Canada and US
3:15	Goldleaf Publishing	Branch Always Software
4:00	ISD Marketing	ISD Marketing
4:45	Gadgets By Small	

Door Prizes!!

Don't forget to drop your ticket stub in the Door Prize barrel at the WAUG user group booths. Door prizes include a Grand Prize drawing on Saturday for a complete Calamus, Font Editor and Outline Art package donated by ISD Marketing and a Grand Prize drawing on Sunday for a complete 1040STE system with color monitor donated by Atari Canada! (Note: You do not have to be present to win the 1040STE system. Info on door prize drawings is contained in the show brochure.)

Highlights

Come see the new SST 68030 upgrade from Gadgets By Small in action! Stop in at the JMG Software booth for the first public showing/release of HyperLINK. See the new Hotwire and MultiFile updates at the CodeHead booth...and bring your original CodeHead software disks for upgrading at the show! Check out the many new products being carried by Goldleaf Publishing. Get your copy of Menu Plus at the Rimik Enterprises booth. Stop at the Gribnif booth to see their Call NeoDesk accessory, NeoDesk 3.02, NeoDesk CLI, CardFile 3.0 and more! In fact, there's so much to see at the show we can't possibly tell you about it all. Come on out and see it all for yourself!

Details/Directions

Show times are 10-6 on Saturday and 10-5 on Sunday. Tickets are only $4 Canadian per day at the door, and children under 12 will be admitted free of charge when accompanied by an adult.

For attendees driving in via Michigan:

Take I-94, I-75 or I-96 to the Ambassador Bridge (Bridge to Canada). Once over the Bridge (there is a $1.50 US/$1.75 CAN toll), follow the signs leading to Highway 3 and you'll be on Huron Church. Follow Huron Church south, past E.C. Row Highway and Cabana Rd. Follow the curve onto Highway 3 when it splits from Huron Church (Mac's Convenience Store is at this corner, for those of you who prefer the "landmark" method of directions). Shortly after the curve, the entrance to St. Clair College comes up on the left. Signs will be posted along Huron Church and at the college entrance both days of the show.

For attendees driving in via Toronto:

Take Highway 401 west to Windsor. Shortly after Highway 401 merges with Highway 3, the entrance to St. Clair College will appear on the right.

Still Not Convinced?

For more information on the show, contact Craig Harvey, President of WAUG - Ann Arbor at (313) 994-5619 or Brian Cassidy, President of WAUG - Windsor at (519) 966-0305.

>Well, it would do more than that. As Bob mentioned, parts of GEMDOS (BIOS
>and/or XBIOS?) are closely wed to that controller. If they used a new
>controller, it would be very difficult to make it appear to be the WD1772,
>and software that talks to the contorller would also fail.

This would only matter to copy-protected games that use a disk-based copy protection scheme. Because the O/S provides fast and flexible disk routines, the vast majority of software doesn't re-invent the wheel and uses them, even many slick games. I realize that Atari considers the rule-breaking games an important asset in its software base. However, eventually they are going to have to make the jump to higher density media.

How large a jump should be made without creating 3 different formats? What format will most packaged software start coming out in? If the jump isn't large enough, companies won't bother to use the larger format, try to sell to a larger base, and just ship a bunch of 720K disks that the user is going to have to swap in and out and that will limit the size of executables. If one jumps all the way out to 21M, things become easy that were once inconvenient or impossible, and a software company might release a product in that format simply because it adds so much to the capabilities compared to other packages coming out in the small format.

Let's take the example of a game. High speed sound samples and pictures take up a lot of space. With 21M available, these things become pratical; you can sprinkle them liberally throughout the software, benefitting creativity. Someone might be tempted to release a Mega-game in that format, pulling customers towards the new technology like flies. Moreover the samples and executables wouldn't take 5 minutes to load because:

1) transfer rate would be radically faster,
2) decompression would not be needed,
3) You can use DMA.

As long as we stick with 720K, there's only so many high-speed samples
you have access to at once. Improvements would be similar with business
software, including the fact that users wouldn't have to worry about
installation (yet), already giving the software an ease-of-use advantage.

>Another problem is that Western Digital told ATari that there would no longer
>be a WD1772. What do you put in 1040STEs? SCSI floppies would be awfully
>expensive for a low-end machine.

Right now, yes. I like the idea of seeing very cheap hardware
available. It does wonders to increase the market share. But
eventually these people try to do serious things with their machines
and will come to the conclusion that one, 800K drive is not enough for
their needs and will want to upgrade their hardware. When they do, Atari
should be ready for them with a standard. What I am saying is they
should be hinting at developers and users that the standard they should
upgrade to is 20.8 megs by using the technology in the high-end machines.

Even today a $300 20M drive would already be a cost-saving option for
the Mega STE. Get rid of the hard disk and floppy and replace it with
one unit. In the future, it is not unreasonable to expect that the price
of the 20.8 megs will come down to a more affordable level, making
them practical even on low-end machines.

Lastly, there is the competitive factor. A few people will make the
decision on whether to buy or not to buy a computer based on whether
they offer better hardware than the competition. If 720K is all
that's available, they may be prompted to look at a different system.
Cheap clones commonly come with 1.2 or 1.4M drives and hard disks now,
making 800K seem less functional and therefore less attractive.

In all of this I am assuming that the media cost of the 20.8's will be
affordable. If not, then all of this is garbage. 1/2 :-)

Michael:

Even though you mentioned that you do not need a document processor
I would like to use the opportunity to plug Wordflair II. I use
Wordflair II for all my text processing on the Atari (the reason for that
is that I have written some parts of it).

Anyway, it has all the features I need in a basic word processor like
tabs, indents, hyphenation, spell-checker, and automatic page numbering.

I get all this with decent looking output (yes it works great with FSM)
and once in a while when I do want to import a graphic or mail-merge a letter
to a couple of addresses I can do so without having to set up a new
program, convert formats and mess around with printer-drivers.

I think you should check out Wordflair II. If you would like more
information send me a note or give me a call at

> no matter what compiler you buy, although it was specifically designed
> for use with Personal Pascal).

I would just like to correct you on one point. Personal Pascal has been coninually upgraded since its release, and the bugs present in earlier versions have been corrected. You CAN pass procedures and functions as parameters now, and the in-code .RSC features now work better than ever. The current version is 2.05, and the program is far from "dated". I use it at home to write programs for my Computer Processing Class, which uses Turbo Pascal. I haven't seen Prospero Pascal yet, though, so I won't comment on it.

Just out of curiosity, why would a British company last any longer than an American of Canadian company? ICD is a solid company that supports all of its products. They are also a thriving company.

With Dumas uud you do not even need any file naming at all. It is
sufficient to concatenate the files and pipe the result through uud.

3576. MiNT/MGR questions

Newsgroup: comp.sys.atari.st
Date: 1991-05-02 09:46:30 UTC
From: dpg@cs.nott.ac.uk
Message-ID: <1991May2.094630.15445@cs.nott.ac.uk>
Source record: 232626

Can anyone recommend a good editor to run under MiNT with MGR? I'm currently using JOVE, but it doesn't read /etc/termcap. Does GNU EMACS? (Memory is not a problem.) It should preferably be an Emacs clone.

Also, does anyone know of a RAM disk on which you can run minit to make a Minix disk? I am using a cutsom R.D., but running minit on it leaves only about 8% of the disk free! (500k R.D.)

There are two such programs:

(1) BigScreen 2 (SciLab) runs on all STs, STEs and TTs, supports hardware scrolling on STEs and the new resolutions of the TT (given you have a TOS version >= 1.04). It can be configured by a DA or a CPX and handles resolution changes correct. Alas, it's a commercial program and it supports only scrolling screens.
(2) There is a commercial program by `Application Systems Heidelberg' which only runs on STs, but HAS the ability to shrink the screen.

3578. MAS (Modula-2 Algebra System) Version 0.6

Newsgroup: comp.sys.atari.st
Date: 1991-05-02 10:44:23 UTC
From: kredel@unipas.fmi.uni-passau.de
Message-ID: <1991May2.104423.13341@forwiss.uni-passau.de>
Source record: 232693

MAS Modula-2 Algebra System

Computer Algebra Group
University of Passau, Germany

Version 0.60

Abstract

MAS is an experimental computer algebra system combining imperative
programming facilities with algebraic specification capabilities for
design and study of algebraic algorithms. MAS views mathematics in the
sense of universal algebra and model theory and is in some parts
influenced by category theory. We give an overview of system design,
the current state of the MAS project and the actual distribution.

Major changes between release 0.30 and 0.60 are:
----

1. added language extensions for specification capabilities,

2. added a parser for the ALDES language and
possibility for interpretation of ALDES programs,

3. added a linear algebra package,

4. added an interface between the MAS language
and the distributive polynomial system,

5. improved symbol handling by hash tables
combined with balanced trees,

6. EMS support for IBM PC implementations.

The minor changes between release 0.30 and 0.60 are:

1. PRAGMA construct for the state definition of
the MAS executable program.

2. Overloading of MAS arithmetical operators
by generic function names.

3. Typed string constants in MAS expressions.

4. VAR parameters in MAS procedure declarations in
ALDES style.

5. Static scope analysis by the parser.

6. Explicit stack overflow check since not all compilers
handled stack overflow correctly.

Introduction

Starting point for the development of MAS was the requirement for a computer algebra system with an up to date language and design which makes the existing ALDES / SAC-2 algorithm libraries available. At this time there have been about 650 algorithms in ALDES / SAC-2 and in addition I had 450 algorithms developed on top of ALDES / SAC-2. The tension of reusing existing software in an interactive environment with specification capabilities contributes most to the evolution of MAS.

The resulting view of the software has many similarities with the model theoretic view of algebra. The abstract specification capabilities are realized in a way that an interpretation in an example structure (a model) can be denoted. This means that is is not only possible to compute in term models modulo some congruence relation, but it is moreover possible to exploit an fast interpretation in some optimized (or just existing) piece of software.

Overview

MAS is an experimental computer algebra system combining imperative programming facilities with algebraic specification capabilities for design and study of algebraic algorithms. The goal of the MAS system is to provide:

* an interactive computer algebra system
* comprehensive algorithm libraries, including
the ALDES/SAC-2 system [Collins 82],
* a familiar program development system
with an efficient compiler,
* an algebraic specification component for
data structure and algorithm design
* algorithm documentation open to the users.

Key attributes of the MAS system are:

* portability (it is portable to a
computer during a student exercise `Praktikum'),
machine dependencies isolated in a small kernel,
* extendability (it is possible to add
and interface to external algorithm libraries),
open system architecture,
* transparent low level facilities:
storage management (garbage collection
is provided without user cooperation),
stable error handling (no system break down on
misspelled expressions and runtime exceptions),
input / output with streams (no changes are
required to existing libraries to redirect I/O).

* effectivity (critical parts can be compiled and
still be accessed interactively)
* expressiveness (possiblitity to specify
abstract algebraic concepts like rings or fields)

The goals and attributes have been achieved by the following main design concepts:

MAS replaces the ALDES language [Loos 76] and the FORTRAN implementation system of SAC-2 by the Modula-2 language [Wirth 85]. Modula-2 is well suited for the development of large program libraries; the language is powerful enough to implement all parts of a computer algebra system and the Modula-2 compilers have easy to use program development environments.

To provide an interactive calculation system a LISP interpreter is implemented in Modula-2 with full access to the library modules. For better usability a Modula-2 like imperative (interaction) language was defined, including a type system and function overloading capabilities. To increase expressiveness high-level specification language constructs have been included together with conditional term rewriting capabilities. They resemble facitilies known from algebraic specification languages like ASL [Wirsing 86].

Further design issues are:

MAS views mathematics in the sense of universal algebra and model theory and is in some parts influenced by category theory. In contrast to other computer algebra systems (like Scratchpad II [Jenks 85]), the MAS concept provides a clean seperation of computer science and mathematical concepts. The MAS language and its interpreter has no knowledge of mathematics and mathematical objects; however it is capable to describe (specify) and implement mathematical objects and to use libraries of implemented mathematical methods. Further the imperative programming, the conditional rewriting and function overloading concepts are seperated in a clean way.

MAS includes the capability to join specifications and to rename sorts and operations during import of specifications. This allows both the specification of abstract objects (rings, fields), concrete objects (integers, rational numbers) and concrete objects in terms of abstract objects (integers as a model of rings). Specifications can be parameterized in the sense of lambda-abstraction.

The semantics of a specification can be described either by implementations, axioms or models. The implementation part describes (imperative) procedures and data representations.

The axioms part describes conditional rewrite rules which define a reduction relation on the term algebra generated by the sorts and operations of the specification. The semantics is therefor the class of models of the term algebra modulo the (congruence) relation. Currently there are no facilities to solve conditional equations.

The model part describes the association between abstract specifications (like rings) and concrete specifications (like integers). The semantics is the interpretation of the (abstract) function in the model. Operations in models can be compiled functions, user defined imperative functions or term rewrite rules. The function overloading capabilities are realized by this concept. Dynamic abstract objects like finite fields can be handled by a descriptor concept.

Evaluation of functional terms is as follows: If there is a model in which the function has an interpretation and a condition on the parameters is fulfilled, then the interpretation of the function in this model is applied to the interpretation (values) of the arguments. If there is an imperative procedure, then the procedure body is evaluated in the procedure context. If the unification with the left hand side of a rewrite rule is possible and the associated condition evaluates to true, then the right hand side of the rewrite rule is evaluated. Otherwise the functional term is left unchanged.

In contrast to functional programming languages (like SML [Appel 88]) which implement typed lambda calculus the types of operations are not deduced from the program text but must be explicitly defined in the specification of an operation, in a variable declaration or in a typed string expression.

A weak point in the current MAS design is that the language is only interpreted. This is actualy not a handicap in execution speed since compiled libraries can be used, but in a too weak semantic analysis of the specifications. This means that certain errors in the specifications are only detected during actual evaluation of an expression.

Achievements and Current State

The steps towards the MAS system have been:

* definition of a syntax transformation scheme between ALDES and Modula-2;
development of a translator and translation of most of the ALDES / SAC-2 libraries to Modula-2;
* development of a storage management system in Modula-2 with automatic garbage collection in an uncooperative environment;
implementation of a input / output system in Modula-2 with streams;
* implementation of a LISP interpreter in Modula-2 with access to the compiled procedures (using Modula-2 procedure types and variables);
* definition of an imperative Modula-2 like interaction language;
* implementation of a parser for the interaction language and corresponding modifications to the LISP interpreter;
* design of high-level language constructs for algebraic specification and a type system with function overloading capabilities;

modification of the language parser and the interpreter;
* design of specifications for relevant algebraic structures.

Steps 1 and 2 were subject to the restriction that the interface had to be compatible with the existing ALDES / SAC-2 libraries. Steps 1 and 2 have been reported in [Kredel 88]. Reports on steps 3, 4, 5 and progress reports on step 6 have been given in [Kredel 90]. A reasonable state of step 6 has been reached during end of 1990. Step 7 is currently under work.

Versions of the MAS system are running on Atari ST (TDI and SPC Modula-2 compilers), IBM PC/AT (M2SDS and Topspeed Modula-2 compilers) and Commodore Amiga (M2AMIGA compiler).

The ALDES/SAC-2 libraries have been implemented including the Polynomial Factorization System and the Real Root Isolation System. From the DIP system the Buchberger Algorithm System and the Ideal Decomposition and Ideal Real Root System have been implemented. Groebner Bases are also available for non-commutative polynomial rings of solvable type. The combination of the MAS programs with numerical Modula-2 libraries has been tested. The mathematical libraries have been enlarged by a package for linear algebra.

Some logic programming facilities have been incorporated by means of the conditional rewriting capabilities of the algebraic specification component. Further there is a parser for the ALDES language and the MAS interpreter is now able to evaluate ALDES statements (although with low performance). In the symbol table system the unbalanced symbol tree has been repaced by a hash table with balanced symbol tree entries.

The current development concentrates on filling some gaps in the ALDES / SAC-2 and DIP libraries, the design of suitable specifications for relevant algebraic structures and completing the system documentation.

Availability

MAS (0.3x and 06.x) is available on electronic networks (internet) via anonymous ftp from:
alice.fmi.uni-passau.de = 123.231.10.1
or from the author.

Disk Contents / Distribution

MAS.EXE, MAS.PRG - execuable MAS program

MAS.INI - start up data set for MAS

\HELP - Modula-2 definition modules

\SPEC - Specifications

ED.EXE - mini editor
EDITOR.PRG - microEMACS

*.IN - input data sets for MAS

*.OUT - output data sets for MAS

MASTUT.ARC - MAS tutorial in LaTeX
MASDEF.ARC - MAS indexes in LaTeX

READ.ME - how to use and start MAS

RELNOTES.TXT - notes on the actual release of MAS

Installation: no special installation procedures are required,
just copy all MAS files into some directory and start it.

Start - Stop

- start 'MAS.EXE' or 'MAS.PRG'

- banner 'MAS Version r.xx'

- system prompt 'MAS: '

- system answer 'ANS: '

- leave with 'EXIT.'

> You need any one of Tom Hudson's ANIMATE programs. His last, ANIMATE4, is
> at atari.archive.umich.edu in atari/graphics under the filename ANIMATE.LZH.

Can anyone tell us what Tom's doing these days? I heard he'd stopped writing programs for the ST because he wasn't making a living out of the proceeds. Is he still programming at all, and if so, what programs for which machines?

3581. Re: DESKJET printer drivers

Newsgroup: comp.sys.atari.st
Date: 1991-05-02 13:27:13 UTC
From: wilsona@dcs.glasgow.ac.uk
Message-ID: <1991May2.132713.5413@dcs.glasgow.ac.uk>
Source record: 232650

Whilst on the subject of printer drivers in general, could someone post details of the 'printer.sys' file most commonly found referred to in the 'assign.sys' with driver ID 21 ? I have a printer which emulates an Epson, but most Epson drivers do not use the quadruple density graphics mode which my printer has. I have tried hacking the printer.sys file... I can get the printer into the correct mode, but the driver only sends enough data for 960 dots per inch, whilst I want 1920. A posting of this files structure would be of great help to me - output from timeworks is really horrible, I'm sure my printer can do better.

>Just fyi, the Mark Williams library source code is available for a price.
>The compiler innards seem to be kept pretty hush-hush, though.

What the Mark Williams people have let out (that I know of) is that the ST C compiler is a 'clean room' version of the UNIX portable C compiler (specified to behave the same way, but no source code in common). It was done in conjunction with the development of 'Coherent'. The compiler itself #define-s the symbols __GEMDOS__ and __STDC__ (I don't know the value __GEMDOS__ gets, but __STDC__ gets the value 0). If you call them and ask for Atari ST C support, the person helping you will have access to the compiler source code.

I should clarify myself a bit: ST C is _related_ to the Coherent C compiler, it isn't necessarily the same.
Steve saj@chinet.chi.il.us

3584. Two More Mega STE Question.

Newsgroup: comp.sys.atari.st
Date: 1991-05-02 14:12:45 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991May2.141245.18540@newcastle.ac.uk>
Source record: 232504

This question was propted by the resent discussion about TT hard drives.

(1) Can the Atari ASCI-SCSI addapter and software on the Mega STE support more than one SCSI device?

(2) Am I correct in assuming that the Mega STE comes with a battery backed real time clock?

Thanks,

Dave H.
(D.C.Halliday@newcastle.ac.uk)

>a 1040ST, and when you have a bunch of ACC's loaded, I'm wondering
>if I'll might have a problem. It is really that touchy about
>RAM?
>[...]

My recommendation goes to Lattice 5. A friend of mine stepped up
to Lattice from Laser, and I've played with Turbo some. The things that
might make me go with Turbo are the excellent help facility and the debugger,
but the Lattice library manuals are pretty good so the help that Turbo
provides is only a nominal. As for the debugger, who has bugs?? :-)

Lattice was not practical from it's editor/environment. It takes up
too much memory. (That's on a 1Meg machine, with HD) You can compile single
files nicely from the environment, but if you need make like I did, it
doesn't work out too nicely. I tried to install make as a tool so I could
run it with a single keypress, but I ran out of memory. But I prefer the CLI
anyway, and then no problems.

Some changes to the C compiler table

->name memory src price ANSI Debuger Notes
->---
->GNU C 2Meg+ yes nil Y poor for ST UNIX origins
->Sozobon C 520K yes nil N none?? PD
Low Level
->MW C 520K no #110 N Src Level No longer updated
->Prospero C 520K no #100 Y Src Level Links to other Prospro langs
->Turbo C ?? no ?? Y Src Level Only in german
R 1Meg+
->Lattice V5 R 1Meg+ no #110 Y Low Level Optomiser
->Laser C R 1Meg+ no #100 N Src Level Very fast compile times
->---

->Notes: Prospro C links with other Prospro product because it uses the GST
->format and not a propriety format. Some other compiler may offer GST link
->format also (I know Lattice C offers both GST and Lattice libraries.)

->The R in the memory section indicates that 1meg of memory is recomended but
->the compiler can be run in 520K.

->As a recomendation I would say the following if you have lots of memory, hard
->disk and no need for commercial support or documentation go for GNU C. If on
->a budget and have a less powerfull setup Sozobon should serve you well. If
->good profesional support is your prime thought I would recomend Prospro C.
->Turbo C is good if you read german. If executable efficiency is your prime
->criteria then Lattice C can't be beeten (though Turbo C is close). Finally if

I think TurboC is a bit faster in execution times than Lattice C. But TurboC
has 16 bits ints where Lattice has 32 bits -- thats the difference.

->compile speed is required then Laser C is the best bet (I'ts one pass

Hmmm. TurboC is also one-pass. And very fast compilation!
Also its integrated edit-compile environment is a very nice way to write
&& debug GEM programs (also due to its build-in online GEM manual).

->compiler compiles at an order of magnatude faster than many of the
->other compilers.)

When one wants to compile U*IX programs conformance to U*IX libaries is
also important. Of the compilers i know the order of compliance is:
GNU - MWC - Sozobon - TurboC.

I don't know about the other ones.

->So each compiler has its strengths.
True.

->For those wondering what my bias is I own GNU C and Lattice C Vsn5.

I own GNU (but not enough memory :-(), Sozobon (slightly buggy &&
slow compilation), MW C (Unix like environmemt), Megamax (Old version of
LaserC), MJ C (An old PD C version -- slow, subset of K&R) and TurboC
(Fast in compile && execute, but ANSI only -- a drawback sometimes).

>pinhead may be compatible with a few more packages but there is nothing to
>it.

Doesn't Pinhead simply compress executables into a self-extracting form that
takes less disk space and therefore less time to load?
Is this what TOS 1.4 fastload does, or is there any benefit in using both
methods?
The time to load an application program is perhaps not a very significant
factor if the program is just to be loaded in and much time then spent working
in the program. On the other hand major savings in disk space matter quite a
lot to most users - from single floppy machines up to Gigabyte hard disks.
The shorter load time is just a useful side effect of the data compression and
is paid for by the time taken to compress the files (also the extra CPU load
during uncompression in a multiprogramming environment).

Try stdaux, some compilers reserve that name for the serial port. Don't know about gcc though.

>
>I get all this with decent looking output (yes it works great with FSM)

All righty, now, does it come with FSM GDOS? If not, how do we get it?
If not, we still get to use crummy ol' GDOS until Atari decides to release
FSM GDOS?

BTW, does FSM GDOS work as a direct replacement to GDOS, like G+Plus, or
do the programs which currently run GDOS, have to be modified to look for
FSM?

>the Beetle mouse, and it's also very nice. I'm one of the lucky few.
>I've got a really good Atari mouse.

Beware! Faster mice (ie higher dpi) are not always better. At some point,
the ST hardware cannot handle the increased input, and you get the 'sticking
pointer' problem. Try this: move your Atari mouse very quickly in any
direction (I mean VERY quickly, like a snap). You will notice that the
mouse pointer will kind of "shudder", but will not move in the desired
direction. Basically, you are overloading hardware/software with too much
mouse output. Now, the higher dpi mice give more output per inch moved. This
means that this overload is easier to attain with the higher dpi mice. I
have a buddy who cannot use his Golden Image mouse because he would have to
"pace" himself to get it to work. A better way to get a "faster" mouse is
through software acceleration, which should not have this problem (and you
can choose from direct, proportional, exponential, etc, types of acceleration).
There are several PD accelerators which work well (I use MouseDoubler2). Thus,
if you are considering purchasing a third-party mouse, make sure that the
dpi is not too high (unfortunetely the marketeers seem to think that bigger is
better when it comes to dpi). Failing that, you should find out if you can
set the dpi rate with a dip switch or pot or something. I believe the Atari
mice are rated at 150dpi. I have seen mice advertised at up to 400dpi (thus
meaning that you would have to move the mouse only about 1/3 as fast to get
it to "shudder"). You will often see ads proclaiming "No mouse accelerator
needed!" on such mice. This is true, but the damn things force you to
slow down (and at least in my case, miss what I am trying to point at)!!

```
```Sorry to have implied that. I don't know if it will be dedicated to
```that sole purpose. That's all that Bob mentioned about it, though.
`
`I didn't think he said it would be a factory. Sounded to me like they had
`hired people to reverse engineer the WD1772 and do a layout for one that
`would run faster.

Both the San Jose Mercury News and the Jewish Bulletin reported that Atari and the Israeli government are negotiating (close but nothing signed yet) for Atari to open a manufacturing plant in Israel, with significant incentive (financial) from the Israeli government, who are hoping to start a high-tech business park. The plant would apparently produce most types of Atari hard-ware (though I believe the Singapore plant would remain) and would give (again, I'm not positive) Atari major advantages in dealing with the EC.

I mailed this guy details on Atari Sweden, but this part is meaningful for everybody:

The only differences between Swedish TOS and English TOS are the keyboard mapping and the text in the Desktop. The underlying code is all the same. If the problems have to do with keyboard mapping or text, then a different country could make a difference, but if the problems are anywhere else, you should describe them so we can decide if they're TOS bugs. It may be that what you've encountered is already fixed. There have been updates to TT TOS; the current release is 3.05.

To: rmacgreg@cs.strath.ac.uk

Thanks for the feedback. I've tried a few variations but without success. My brother mentioned that he thought "Little Green" may be interfering with the execution of the "Bootmaker" program.

I'll remove LG completely from the configuration process.

Yes, I've used a text editor and looked at the file(s) contents but I really don't know what I'm looking for. There is bin code and ascii text intermingled in the bootmaker and autoboot programs.

The auto boot program shows the file path and name of the program to be autobooted "a:\pro24.prg" as well as machine language?

P.S. Do you "correspond" with anyone in Christchurch or Manchester or Portsmouth?

Regards....Jim, Erin, Ontario, Canada.

>
>The pc board is cut off where the host adapter would be, and the plastic
>case has been redesigned to prevent intalling a hard drive mechanism.

NO NO NO. The case has not been "redesigned" to prevent anyone from
installing a hard disk in it. The case is not finished on the Mega STe1.
To install the hard disk, they apparently have to remove some posts from the
mold, and in the no-hard-disk version, they, naturally, haven't done this.
I can't speak to the host adapter issue, but I doubt very much that the PC
board has been deliberately cut off to prevent you from installing one. I
have even heard that Atari is working with a host adapter manufacturer which
might provide an add-on for the MSTe1.

# 3605. Using UNITERM to load files to UNIX machines

Newsgroup: comp.sys.atari.st
Date: 1991-05-02 20:23:42 UTC
From: tgardenh@nmsu.edu
Message-ID: <1188@opus.NMSU.Edu>
Source record: 232690

Hardware: a very old Atari 520ST (just recently had the TOS chips put in)

Software: UNITERM

Other Hardware: a Sun 4/280 running SunOS 4.0.3

Goal: I want to take files (mostly documents) and load them from my Atari
to the Sun.

My problem: When I start up UNITERM I get an error saying something like
"error in defaults". I press return and load up the defaults
I need to dial up. I then dial up to the Sun computer and
type "kermit" and then, once inside kermit, type "server". I
then press "alt-t" to get the menu to send the files. I chose
send. The next window comes up and reports that I get too
many errors when sending. I have been able to download files
before, but I don't seem to be able to duplicate it. (Sometimes the
Sun displays a message about "unknown server command".) Can
someone please tell me what I am doing wrong. I really need to
be able to download these file before the end of the semester. and
I am really getting frustrated.

BTW, a friend who owns anothe Atari ST gave me the UNITERM program, so I have
not done much file transfering before.

Thanks so much for any help.

TOS 1.4 and pinhead both suppress filling all of (allocated) memory with
zeroes before loading and executing the program. That's all. I got a
program that compressed programs, which then un-compressed upon executing,
but I had a lot of trouble with it. I got it from atari.archive, but, since
having all the trouble, I haven't used it much, and therefore already
forgot the name.

3610. VME & SCSI vendor/product list

Newsgroup: comp.sys.atari.st
Date: 1991-05-02 21:21:51 UTC
From: fsctc@csduts1.lerc.nasa.gov
Message-ID: <1991May2.212151.19637@eagle.lerc.nasa.gov>
Source record: 232643

Hi. I'm looking for a directory of vme peripheral device vendors. Is there such a thing? What I hope to do is to find the vendors for a Ethernet and a high-speed line-imaging data acquisition board for my TT. Also, is there a similar directory for SCSI devices?

I don't know if the Ethernet board has to fit on the TT's VME bus or not. If not, where will it fit? What kind of software will be available? I want to connect this machine to the DARPAnet via Ethernet hardware and TCP/IP protocol.

The second item that I'm looking for is the controller and acquisition board for a line-scan camera. There are a host of them for the AT bus, but they're all too slow. To speed up data acquisition, the boards often have huge onboard RAMS, sometimes 8MB. After taking data, they usually slowly transfer the info to the hard disk via the ISA bus. I want to be able to scan 5000 lines/s, each with 256 pixels, each pixel digitized 8-bit. I also want to store 10 sec of continuous data once at a time, preferrably all using the TT's memory (which will be expanded to 26MB very soon).

If you have even a remote idea on these subjects, please respond. Thanks.

LF>jd> Atari Megafile 30 in partition D have become invisible. The problem

LF>I got the same problem using CHEETAH on BGM-partitions of my harddisk.
LF>There I could only save one of the BGM-partitions. Cheetah destroyed the
LF>root sector of the destination hard disk.

Hmm, somebody mentioned somewhere [;-)] that CHEETAH only works with ICD BGM
Partitions.

Hmm, let's see if I can find the Docs ...

Yep, here we go:

> BGM Compatibility: Cheetah now supports ICD's new BGM format for both
> source and destination drives. A different aglorithm had to be
> developed to support the non standard cluster sizes. This new routine
> optimizes the files as the are being copied. The new copy method can
> also be selected to be used when copying between standard partitions.
> Progress is also displayed during the copy.

So, it doesn't say it won't work with Atari BGM Partitions but it says it
supports ICD's format which seems not to be the same as the Atari format.

G'day Mick

3612. Atari Calculators

Newsgroup: comp.sys.atari.st

From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <5151.282050be@miavx1.acs.muohio.edu>
Source record: 232503

Well, I was cruising my local Odd/Big Lots looking for some bargains, when lo and behold, I found some Atari Calculators!! Of course I had to buy one, so I bought one that is a ten digit calculator, stores up to 125 phone numbers, can auto-dial those phone numbers, and can store up to fifty different events. It was a little pricey at $20 but I think it was worth it! (It did say Atari!)

So if you wanted another little Atari gadget, check out you local Odd/Big lots!!

Source record: 232694

John STacy asked about the Windsor/Detroit Atarifest this weekend..

Yes, it's on, and it looks like it's going to be pretty good!

From Toledo, take I-75 North, follow the signs to the Bridge to Canada, from there follow the signs to Highway 3 in Windsor, and you'll be on Huron Church... go South... (yes, geography fans, Windsor, Canada is to the SOUTH of Detroit, Michigan..)

Past Cabana Rd., follow Highway 3 when it splits off of Huron Church, and the entrance to St. Clair College will be on the left.. there should be signs along the roads approaching the college, just in case..!

No, that's DC Squish, or any similar packer.

>Is this what TOS 1.4 fastload does, or is there any benefit in using both
>methods?

The fastload bit doesn't let the ST clear the remaining memory before it
loads a program. Pinhead does the same; actually, I've heard that Pinhead
is actually faster than the fastload bit setting. I tried it on a 2 meg
machine and the difference was one second. I run Pinhead and have my
programs with the fastload bit set on my 4meg machine.

>The time to load an application program is perhaps not a very significant
>factor if the program is just to be loaded in and much time then spent working
>in the program. On the other hand major savings in disk space matter quite a
>lot to most users - from single floppy machines up to Gigabyte hard disks.

>during uncompression in a multiprogramming environment).
>

If you've never used Pinhead or set the fastload bit on a TOS1.4 and up machine,
then you should really check it out. There is a great speed difference
when loading programs, even on a one meg machine; the difference can be
seen especially when loading a lot of AUTO folder programs.

3616. Spectre Questions

Newsgroup: comp.sys.atari.st
Date: 1991-05-02 23:50:51 UTC
From: dcrevier@jarthur.Claremont.EDU
Message-ID: <11975@jarthur.Claremont.EDU>
Source record: 232543

I recently got a used Spectre 128, and I have a few questions. I am using Spectre 2.65 and system 6.0.3.

1. I have a 24-pin Nec P2200 printer, and I am looking for a printer driver. I am too cheap to buy one, so I am looking for a public domain one. I found someone who wrote one for panasonic 9 pin printers, and he has tried to convert it to work with my printer. The problem is that on every few lines, it gets messed up and starts rotating the bits vertically, so that on a line you see for example the bottom of a character above the top half. It does this for the rest of the line. The author is convinced that this is a problem with Spectre because it does not happen in the 9 pin version. It is acting like it is loosing some bits, so I was wondering if maybe there is some problem in the conversion from serial to parallel. Does anyone have any ideas? Or maybe know of another PD (or cheap) 24-pin printer driver?

2. Spectre gets an illegal instruction error (one that Spectre reports, not the Mac) when I try to create a postscript file using the laser writer printer driver from the chooser and using command-K or command-F. Does anyone know of a way to get this to work?

3. Does anyone know of a program that will let you have a picture on the desktop that works with Spectre?

Thanks

Dan Crevier

Timeworks DTP will not run in mono and color without having
separate ASSIGN.SYS files for each. You may have to go back
and re-install it to get it to run in mono. I tried to get it to work
on both my color and mono monitors (so I could just switch back
and forth) but no go.

You do not need separate assign.sys files. Find all of the monochrome screen font files on your master disk and copy them to the folder containing all of your GDOS font files. Then load assign.sys into your text editor and look for the line "04p screen.sys". Type in the list of all the monochrome screen font files after this line and save this new assign.sys. Now Timeworks DTP will work in both medium and high resolution. I did this and have never had any problems.--

3620. Question: Pascal for the ST?

Newsgroup: comp.sys.atari.st
Date: 1991-05-03 02:15:44 UTC
From: hunt@jjmhome.UUCP
Message-ID: <10179@jjmhome.UUCP>
Source record: 232623

I think the subject says it all.

1. Where can I find a pascal (good) compiler for the ST,
and
is it commercial?
if so, how much
else
where on the net can i find it? (a.a doesn't seem to have it)

2. This doesn't have to do with the subject, but if i wanted to learn C, how
much work would it be for me to do so? (it took little effort to learn
pascal, and i know C is somewhat the same... i looked at it before) and
what would be a good book to get me started with it? (with sozobon C)

thanx!

Tad Hunt

+why should I have a .sig? and send all the 'i''s through an upcase convert :-)

```
>Does anybody out there know why when I compile the following program
>(with HiSoft's GenST assembler) and run it on my STE the system crashes?

:

>TimerA_int
> rte
> even

:
```

It's a long time since I encapsulated TimerA use in a module :-), but I think you need to clear an interrupt-pending bit on the before you return from the exception.

Check out what TimerB, C and D do, check Internals (though from memory there was a bug in that part :-( ), or grab play.arc from atari.archive and look for the interrupt code that writes to the Yamaha chip.

You're an assembler programmer - you'll enjoy it. :-)

If you get stuck, mail back, and I'll check my modules (at home). It isn't very difficult, just tedious to hold your tongue in just the right way.

Warwick.
PS. As I said, it's been a while - I may be completely off track.

Okay, I may have to eat my words here. What I said was based on conversations with Atari developers. Z-Net corroborates what Bob said. Perhaps the Atari marketing idiots have decided that they should keep people from putting their own hard disks in Mega STEs afterall... Sigh...

Sorry, Bob. I thought (and hoped) that you were wrong. It may still not be true, but I have no hard evidence either.

>official version. After that, I don't care if they go "commercial".
>But I think they sort of owe it to the people who have helped
>them "beta test" this compiler.

I don't think Sozobon could go commercial now even if they wanted to.
People would always regard it as free since it's been free for so long.
Look at NEOchrome. I have had official word from Atari that it is NOT Public
Domain yet PD Librarys are distributing version 1.00 and the CHAOS version.
Sozobon would have to change it's name at least to avoid this.

Anyway I think the Sozobon C compiler is bl**dy great! I use it all the time.
Students here with ST's use it home for their projects.
I just wish it had been supported more by the original authors and the
net's compiler gurus. Atari should bundle it with an ST 'Programming Pack'.

3626. Origami folding editor available for ST

Newsgroup: comp.sys.atari.st
Date: 1991-05-03 10:32:02 UTC
From: michaels@messua.informatik.rwth-aachen.de
Message-ID: <michaels.673266722@messua>
Source record: 232544

The new version 1.5.8 (beta) of Origami is finished. Origami is a folding editor similar to the TDS editor. (Some PC users call it an outline editor.) It's a little bit difficult to explain the principles of folding editors here, but there are enough explanations in the documentation. Origami runs on MINIX 1.5, SunOS 4.1. and on the Atari ST. The source is available for anonymous FTP from:
Server: ftp.thp.uni-koeln.de [134.95.64.1]

Path: minix/beta-test
Files: origami.tar.Z (13-bit compressed tar archive)

If you detect any bugs in the TOS code, please send mail ONLY to Michael Haardt. He heads beta-testing and would like to see any mails concerning it. He will forward a copy of TOS specific mails to me.

Send mail to:
mhaardt@ftp.thp.uni-koeln.de
DO NOT USE THE ADDRESS IN THE HEADER !

You will probably find mistakes (wrong spelled or wrong grammar) in the documentation. Correcting such mistakes would be nice (cdiffs!). The Origami documentation can be formatted with nroff or MROFF.

The beta-test phase will end in June. I will post Origami to comp.binaries.atari.st then. I will not post any binaries until the beta test ends. I will not send sources or binaries by mail (I have to pay for mail, even incoming).

In order to compile ORIGAMI on the ST, you will need Turbo C 2.0 and some utility to convert LF to CR/LF (all source files are in UN*X format, which is not recognized by TC :-( )

Michael Schwingen
Ahornstrasse 36
W-5100 Aachen

I use the Golden Image mouse too, but GEM doesn't actually respond any faster. What your friend may have been describing is the increased throughput gained by having a mouse which you only move half the distance (physically) to go the whole distance (on the screen). Also microswitched buttons make a great difference to the usability of the GEM system.

It's just a pity that the ST doesn't sample the mouse fast enough to use it at full pelt.

I believe to uudecode one file into multi-parts, you have to use the -x
(where x is the no. of lines that you want in the uue file). To UUE, say
for instance, a 100K file called DUMMY.LZH, on the command line, type:
-700 DUMMY.LZH. This will create a series of uuencoded files that are 700
lines long (except for the last file, which will be the remainder, but not
necessarily 700 lines long).

Hi Glenn,
Yes, a "better" (higher resolution) mouse does "appear" to
speed up the system. Or at least mouse pointer movement is smoother and more
accurate. The Golden Image GI-250 scored the best in ST Journal's mouse review
this last year; and I am quite happy with the GI-250 that I have.
There are also couple of new mouse's that have introduced more recently
such as the Beetle Mouse from Talon. Bye.....

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a working PC-Ditto II that I used to use with a 1040ST, but now I have a Mega 2 that has one of those tiny circuit boards soldered onto the 68000, and can't fit the PC-Ditto II adaptor board over it.

I would REALLY RATHER NOT take a soldering iron to my motherboard, especially to the cpu, so I was wondering how feasible it would be to build some sort of adaptor cable to plug into the Mega bus. Could someone post the specifications for a Mega bus? I notice that it has the same number of pins as the 68000; are they the same lines, and if so, how are they mapped?

I've seen ads for Mega bus adaptors for PC/AT Speed, and the two prices I've seen have been $65 and $79, which leads me to believe that it isn't just a simple line by line adaptor. Does anyone have one of these, and if so, could you describe it?

I'm not willing to damage my computer just to be able to use this thing again, but if I can get it attached without too much difficulty, I'd like to know.

Thanks in advance for any information you have to offer.

Michael Kieras

>Is this what TOS 1.4 fastload does, or is there any benefit in using both
>methods?

No, you are thinking of Packer or DC Squish (or some variant therein). What
Pinhead does is prevent the clearing of memory before loading binaries. Since
any well written program should not depend upon a blank "slate" to run
correctly, this is safe and speeds up load time dramatically. The TOS 1.4
fastload bit does the same thing. Note that some programs do depend upon
"clean" memory to work. Pinhead has a provision to allow for clearing of
memory for only the programs that need it (and only the amount of memory
that is needed). I don't think Pinhead hurts anything in TOS 1.4, and it
is more flexible than the fastload bit method. I am sure this is discussed
in detail in the Pinhead docs (I think 1.8 is the latest version). It should
be on atari.archive.umich.edu.

Well, would any driver do? I have one that came with WordUp 3.0 that says
HPLASER. Are all GDOS printer drivers totally software independent from the
application they came with?

>
>I once hard of a product called "Turbo-Jet" (??) my NeoCept (??)

Actually, when I bought WordUp I got offered to buy this also (used). Since I
do not have a laser printer, I did not. However, if you find out that this
is what you are looking for, send me email and I will see if it is still for
sale (from my source).

>a few that sure needed help!
>Kevin
>--

Those that are interested in such things :-) might like this. There are now
at least 4 different variants of the Atari mouse. Here is how to identify
them (the "ball door" is the opening on the bottom of the mouse which allows
the removal of the ball, the rollers are the bars that touch the ball and
relay it's movement to the optical sensors. The rollers are visible when
you take out the ball).

1. Sliding mouse door, thin metal rollers, made in Germany.

2. Sliding mouse door, thin metal rollers, made in Taiwan.

3. Rotating mouse door, large teflon rollers, made in Japan.

4. Sliding mouse door, small teflon rollers, made in ????.

Numbers 1 and 2 are no longer sold, number 3 is the current ST mouse (and does
NOT have the problems of the first two), and number 4 is white and comes
with the TT. I have beaten the crap out of a number 3 for almost three years,
and it still works perfectly.

It bothers me that you're recommending that someone disassemble my code and use it verbatim. Whether or not this is legal, I have no idea, but please note that play.prg is COPYRIGHTED, although it's freeware. It's NOT public domain. This is the sort of thing that makes people not release their software as shareware at all, especially considering that only a handful of people every attach the programmer's name to the "gift" in references like the above.

For the record, I've gotten many requests for my sample playing source code, and I regret that I can't give it out because it's for a commercial product. In the past I have given detailed explanations of how to play digitized sound on the ST, posted here. I don't have time to do it again at the moment, unfortunately.

Instead of disassembling play.prg, please look for resound.arc on atari.archive. If it's not already there, I'll put it there. It's by David Snow and implements the same techniques my routines do. Source is included in the arc file.

I don't mean to flame you, Warwick. On the contrary, I'm glad you post here -- your articles are quite helpful. But consider how you'd feel if I disassembled STrabble and used your dictionary without your permission.

Strange, I bought WordUp V3.0 (as well as all previous versions) and I don't have this driver. I'd sure be interested in getting it though because I've since switched from an Epson to a Deskjet.

I'm currently using Mg2a under MiNT (very occaisionally) and its seems to be okay. However i'll definately try compiling GNUemacs18.55 on it what I get passed my exams and get disk space (and other standard excuses!). I'll also get up to date on the MiNT code. What version do you use? I'm flailing along with 06s (i've got code for 08b but not enough memory to compile it using gcc (had to give the big memory machine back!).

I've heard that it shouldn't be too difficult to build the GNU stuff on MiNT once a small environment (gnumake/gcc) is set up.

>

There are at least 2 choices.
Personal Pascal - distributed by ICD. It is ok, but I would not pay full
price for it. It cannot accept procedures as parameters, a feature
which is heavily used in scientific code. It is a dated product, very
nice back in '87, not so nice now. It can sometimes be found in the
bargin bin for $30. You should also try to find a (used) copy of
Tacklebox ST, which extends Personal Pascal somewhat and provided
excellent documentation for ST programming (it is a good one to find
no matter what compiler you buy, although it was specifically designed
for use with Personal Pascal).
Prospero Pascal - a much better choice. Rock solid, full pascal
implementation. Good accuracy. Well supported (the company is
British, and therefore has a much better chance of being around
for awhile). I have seen it for $89 from Joppa Computer Products
(1-800-876-6040).

> 2. This doesn't have to do with the subject, but if i wanted to learn C, how
> much work would it be for me to do so? (it took little effort to learn

>

As a sub note, all Prospero compilers (C, Pascal, FORTRAN) can share object
files, and have the same touchy feelie front end. Also, the C and Pascal
(I do not know about the FORTRAN) are ANSI.

>explanation from the Atari HD software).

A phrase like "The DMA port on the back of the TT" encourages misunderstanding: there are TWO DMA ports on the back of the TT; one is ACSI and one is SCSI, and you should make that distinction explicit when you talk about the TT.

In any case, you are mistaken. A working setup on an ST will work fine on a TT. What part of this conversation makes you think it won't? The only oddity will be that SCSI drives (like the internal one), if present, will have their partitions appear first in the sequence of drive letters. But if you have a working chain of drives coming out of your ST, and you unplug the end of the chain from the ST and plug it into the TT, all those drives will be accessible and will work just fine.

No, it is not true. Any production TT can be booted in either TOS or UNIX.
UNIX, of course, is not yet a product from Atari, but there is no distinction
between a TOS TT and a UNIX TT; it's all in the software.

I see an opportunity here for me (and others 8-). Assuming Atari doesn't
take back the old style mega keyboards, I'd be willing to part with
$80 (U.S.) for your old style keyboard, for use with an adaptor on my
new STE (*not* mega STE). BTW, since my STE is back ordered, are mega
STE's available in the U.S.A with minimum memory and sans hard drive?
If so, how much? I could cancell my STE order and get one of these if
it doesn't cost more than ~$800 - $900 8-).
thanks in advance, (no Atari dealer is within miles of here!)

>

I used WordWriter several years ago, and like many of the ST word processors of the time, the character buffering seemed very annoying. At times I had type ahead, then it would go away, and just didn't flow very nicely. Someone had told me that this had to do with the architecture of the keyboard interface.

Is this still true, or was it ever an accurate description of the way these things work? I have a very old 1040, and plan to buy a new 1040 STe within the next month; will this change things?

I would like to sell an ATARI Color Monitor SC1224.

I am upgrading to an IBM system, and since there is no
way that I know of to be able to use (cost effectively)
this color monitor with a PC Compatible, I have no further
use for it. Also available is an ATARI Monochrome Monitor
SM124. Only one will be sold (I still want to be able to use
my ATARI)

Prices will be competitive!!

Please reply via email.

(BTW: If anyone knows a cost effective way to use my ATARI SC1224
with a PC using a video card like CGA, please let me know. Also
does anyone know what the dot pitch is of this monitor .51 ??)

Thanks
Saurabh

Thanks Andy, I agree... Laser C is quick and easy to use (I use it ALL
of the time)! Also Laser C always attemps to make as much of its self
memory resident as possible, thereby making it fast for those with as
little as 1 meg.

Hmmm, perhaps this is part of the before mentioned Turbojet package (when I bought it, I copied it from his hard disk so I would get all the bug fixes. Of course, I also have the original disks :-) . I will check into it. Anyway, if this is true it sounds like this is what the original poster was looking for (Turbojet, that is).

Agreed.

[High praise for Maxifile, HotWire, Multidesk, and Codekeys nuked]

I use these (except Codekeys), as well as the Utilities package and
Lookit. Additionally, I use much of the affiliated shareware and
freeware they've put out (and have even registered for it!). It's
great the way that these programs work with each other. Now I have
access to Maxifile from any program that uses the file selector,
thanks to the Little Green File Selector. I find myself using
Arc Shell far more often than DC's Xtractor+.

The down side is that I think some of the programs are growing out
of control. A very healthy chunk of my RAM is used by Codehead stuff.
I like most of the features, but I'm starting to wonder if they are
worth all the RAM they soak up. Maxifile III has both graphic and
textual disk information options. Sure, the graphics look great,
but is it worth the extra RAM? Is the Ledger feature on Hotwire
really necessary? The new Maxifile's file reader encroaches on
many of Lookit's features, and MF III also includes the Zerodisk
function off of the utilities package... I'm paying for lots
of redundant features that really don't need to live in RAM.
Frankly, I'd rather have these functions broken down into seperate
programs and accessories, so I only have to load the ones that I use.
Better still, it would be nice to have a configuration program that
lets the user load or disable functions in Maxifile and Hotwire,
effectively "conditionally compiling" the programs with only the
features you want, and the others greyed out.

But then, all will be forgiven when I've upgraded my RAM to 4 megs. ;)

That said, I swear by Codehead far more often that I swear at them, and
would hate to have to go back to using the standard Atari interface.

I am curious about a couple of Codehead packages that I don't have.
Has anyone tried Midimax? I've seen the demo program, but I wasn't
sure it did anything I can't already do (or would have any reason to
do) with my MIDI software.

And what about G+Plus? Will it make my ST run faster and jump higher? Can I continue to live without it? I've seen it favorably mentioned on the net, but I really don't know what it does.

Mr Chris Wood has actually e-mailed to me saying Lattice C has a good source level debugger(woocm@sx.ac.uk). It seems everyone is satisfied with their C compilers except Alcyon. And to be complete one must not forget MINIX-ST 's C compiler(pretty awful). Someone has just written here that he couldn't compile his code because of lack of 030 and discontinued a support for ATARI. Very sad news. (I thought Turbo C supported everything).
Though its source level debugger for ST is far from perfect, GNU C is by far the
best compiler for us (the price you pay for it is the cost of adding your memory up to 4MB). And if you happned to have access to a more powerful machine (preferably 680x0 machines like SUN3), support for TT030 and source level debugging are no problems. If not, and if one likes to have expert aid, one cannot tell which is the best. But it is very nice that there are some at all.
I don't care for speed because nothing is more of a wast of time than having a buggy compiler. And assembly language level debugging is surely most reliable if not very efficient.

In article <1991May2.133114.26227@mailer.cc.fsu.edu> boyd@nu.cs.fsu.edu (Mickey Boyd) writes:

-Beware! Faster mice (ie higher dpi) are not always better. At some point,
-the ST hardware cannot handle the increased input, and you get the 'sticking
-pointer' problem. Try this: move your Atari mouse very quickly in any
-direction (I mean VERY quickly, like a snap). You will notice that the
-mouse pointer will kind of "shudder", but will not move in the desired
-direction. Basically, you are overloading hardware/software with too much
-mouse output. Now, the higher dpi mice give more output per inch moved.
-This means that this overload is easier to attain with the higher dpi mice.
-I have a buddy who cannot use his Golden Image mouse because he would have to
-"pace" himself to get it to work. A better way to get a "faster" mouse is
-through software acceleration, which should not have this problem (and you
-can choose from direct, proportional, exponential, etc, types of
-acceleration).

I use the Golden Image mouse, and have had no problems. In fact I had terrible troubles with mouse accellerators before I bought it. The Atari Mouse Accellerator (1, 2 and 3) all caused my system to crash occasionally, or cause a reboot loop. (How do I know it was the accellerator? I took it out, and the problem stopped. Real scientific, huh?)

The GI mouse also feels nice in the hand, and has great action on the buttons.

Perhaps your friend should just drink less coffee before he uses his mouse. ;^)

Actually, I tried the new mouse with the accellerator still in, and it was impossible to do anything useful.

I'm sure it's all a matter of personal taste, but I'd say if you have half decent motor control (and remember to turn off your mouse accellerator), you should have no problem with the Golden Image mouse.

jim.devonshire@rose.uucp (JIM DEVONSHIRE) writes ...]

> How do I access files in the Atari archives. Do I have to subscribe,
> pay a fee, join an organization? OR are they free to any interested
> user?

Two archives of ST software are reasonably accessible to readers of comp.sys.atari.st. They're quite different, though, and the differences bear some explanation.

You'll see a lot of references to ``the archives'' and ``terminator.'' Those usually refer to an Internet-accessible site at the University of Michigan that is properly known as atari.archive.umich.edu.

The data at Michigan has been uploaded by various Atari enthusiasts around the world. It's not very well catalogued (although the maintainers are working hard to remedy that). There's quite a lot of it.

If you are at a site on the Internet and have access to a program called FTP, you can log into atari.archive.umich.edu as ``anonymous'' and use your name@site as a password. FTP then can transfer files at high speeds to the host computer from which you access the Internet. Downloading from your host computer to your ST is a separate step.

Because many sites that receive Usenet news are not on the Internet and cannot use FTP, there is a software robot at the Michigan archive that can send you files via email. They will arrive ``uuencoded'' -- a process that changes binary data into printable text to make it safe for mailing. For details, send a message to atari@atari.archive.umich.edu with the word ``help'' in the subject line.

The second archive of Atari ST software is at panarthea.ebay.sun.com, which is not directly accessible on the Internet, although the name might lead you to think otherwise. Panarthea contains only the programs that have been published in the moderated Usenet newsgroups comp.sources.atari.st and comp.binaries.atari.st, and it can be accessed only via email. For details, send a message to archive-server@panarthea.ebay.sun.com containing a single line with the word ``help.''

3659. GEMINI

Newsgroup: comp.sys.atari.st
Date: 1991-05-03 21:43:18 UTC
From: steve@thelake.mn.org
Message-ID: <A2238256803@thelake.mn.org>
Source record: 232457

I unpacked and installed GEMINI from comp.binaries.atari.st last night after only a moderate amount of muttering and cursing about LZH. However, I wasn't able to get the GDOS clone, AMCLITE, to work. It seems to install (but accomplishes nothing) if no ASSIGN.SYS file is available. If ASSIGN.SYS is available, I get at least four bombs. I'm NOT running this from the auto folder -- I'm reluctant to put it there until I'm reasonably sure that I'll be able to boot the computer from the hard disk without it blowing up.

Any tips? I'm using TOS 1.4, a 2.5MB ST, a Supra host adaptor and Supra hard disk software, and a monochrome monitor. The directory layout is the same as that included in Steven Grimm's monster archive, and the fonts are available.

Regarding pinhed, while well-written programs should not require a blank slate, real-life programs apparently often do. I was getting random crashes especially during booting. I was starting to think that my power supply was getting flaky, but figured I'd go through the auto folder analysis. Removing pinhed from my auto folder eliminated my boot-time crashes. I have an awful lot of junk in my auto folder. I don't think it's pinhed's fault, but he's outta there anyway. I guess the moral is: if things work fine with pinhed, great; but if you start getting random crashes ...

>
>Kind regards
> Lutz

My guess is that you reach the 40-folder limit while copying stuff
from one partition to another...If this is the case, then there are 3 solutions
I know of:

1. fldrXXX it's an auto-folder program that lets you specify the
number of folders you can "touch" without problem, by
replacing XXX in the filename with the actual number.
(i.e. to have a 100-folder limit, just rename the program
to fldr100.prg) --- I think the program is PD and
is on atari.archive

2. flushing buffers
there are some programs, like LGSELECT.PRG by Johnson,
that let you **flush** the buffer that is keeping the
accessed folders --- I also thing that LGSELECT.PRG
is SHAREWARE, and it should be
on atari.archive, too

3. the little white button at the back of your computer, called "Reset"
This one always works. 8*) --- This one is for FREE, guaranteed
to work, and right in your own
home.

Please note that I have a Mega 4, with TOS 1.2 in ROM, so I don't know if
the above methods will work on STs with different ROMs and/or configurations

3662. Re: Question: Pascal for the ST?

Newsgroup: comp.sys.atari.st
Date: 1991-05-03 22:29:31 UTC
From: REEVES@SLACVM.SLAC.STANFORD.EDU
Message-ID: <91123.142932REEVES@SLACVM.SLAC.STANFORD.EDU>
Source record: 232510

Actually, the sheets I have from Prospero say that Fortran and C are ANSI standard. The Pascal compiler follows the ISO standard. The data sheet says, "The Prospero Pascal for GEM programmer's environment is a complete implementation if the ISO Pascal standard for the Atari ST." If memory serves, I believe that Personal Pascal follows the ISO standard more closely that the ANSI standard. This along with the almost too numerous to mention extensions that Borland made to Pascal makes for real fun when trying to move code from an IBM Turbo Pascal environment to a Pascal environment on the ST. So, if you need to have transportable programs, you might look into Prospero's IBM Pascal compilers as well.

Terry

3663. new uploads to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-05-03 22:34:45 UTC
From: millert@tramp.colorado.edu
Message-ID: <1991May3.223445.26300@colorado.edu>
Source record: 232458

I recently uploaded the follwoing files to atari.archive.umich.edu
(141.211.164.8). They should be appearing in the atari/newitems
directory RSN. :-)

abformat.lzh : able to format 2 disks at ince, also will map out bad sectors
cham119.lzh : chameleon 1.19 -- load desk accs on the fly
protect6.lzh : ram-resident virus checker, alerts you if it thinks you are
being invaded by a virus.
arcshl25.lzh : Arc shell 2.5
digiubik.lzh : another digital sound player/modifier
xtakey2.lzh : an acc that lets you use extended character set in apps where
you wouldn't normally be able to (or something like that)
cli_1_0u.lzh : new cli from germany w/ a lot of builtins, 100% assembler so
is small. Docs are in German.
p_or_s_2.lzh : print or save it 2.0 - allows you to dump the screen to disk
as well as print it to a printer. Works with epson-compatible
and hp deskjet or any other printer if you use another
alt-help replacement.
pan24drv.lzh : Degas compatible printer drivers for panasonic 24-pin printer.
3 different resolutions.
prtinstl.lzh : replaces the system alt-help print dump with a custom one that
uses degas compatible printer drivers. Includes several
printer drivers with it.
scndrvr.lzh : replaces the alt-help screen dump with one that works with
degas-compatible printer drivers. Also gives you the option
of saving the screen to disk.
sim_eq.lzh : solve simultaneous equations

Enjoy,
todd

I don't know if anyone caught the latest Z-NET article, but FAST TECH has whats called a new upgrade board with a 68000 operating at 20Mhz.

I thought that strange, as I intially thought it was a 020, but no, it is a 68000 at 20Mhz.

Problem is, they don't make em that fast. My immediate suspicions brought back horror articles in the 1989-90's PC mags of manufacturers selecting mass quantities of 286's that were rated at 16Mhz, and operating the few that could run at 20Mhz. People recieved machines that after a few months of operation died, with fried cpu's. QUITE a few were sold of course.

FAST TECH appears to have done the same with this board, and if they have, I will refuse to buy it. I won't recommend it either, I don't care if they test select them for weeks on end.

I hope most people know they don't get something for nothing, as most people do like to believe that and that this is not good hardware design practice to exceed the manufacturers quality specs on the parts you design with from step one. Most computers have it rough enough just with heat, especially all you FANLESS 1040ST/STE owners out there with 4 meg memory upgrades!

I'd avoid this thing like the plague, and would much rather trust Mr. Small's design for 200 bucks more.

The latest version of Pinhead allows you to specify whether you wish to
clear memory or not for any particular program. It also allows you to
specify exactly how much memory to clear. The docs come with a list of
problem programs that require the use of this feature. Using this, you
can still enjoy the benifits of Pinhead for the majority of your stuff.

I'm working with the Windsor/Detroit AtariFest this weekend, and I'm hoping to get a look at a Mega STe1 to try to get the full story on whether it can be expanded or not...

One very hopeful sign, although it doesn't apply much to US Atari users, is that Atari Canada has provided a LARGE number of systems for the exhibitors and developers, including several TT030 systems..

Dealers there will actually be selling TT030 systems, though whether those systems will have any kind of FCC numbers, allowing them to be brought back into the states, remains to be seen..

Just install *.LZH as an UNLZH application and click on the archive to extract it. I haven't actually looked at my version of UNLZH for ages, it is so easy to extract *.LZH archives this way. Same works for *.ARC files with UNARC. Just wish that I could extract ZOO archives as easily. Should be a simple hack of BOOZ -- has anyone done this?

Ditto. While a mouse does nothing to speed up redraws, I (and I expect a lot of people) spend a considerable amount of time just moving the mouse around : selecting files, icons, moving windows etc etc... The Golden Image makes that a little faster without any nasty surprises.

> The Golden Image GI-250 scored the best in ST Journal's mouse

> this last year; and I am quite happy with the GI-250 that I have.

Yup, I *love* my Golden Image mouse. Up until I got it, I had thought the Micosoft Mouse (for IBM types) was the best money could buy. I think the Golden Image is marginally better -- I like the fact that it is wider.

Well, the Epson Laser Emulator LASERBRAIN works 100% on ST, STE and MEGA STE,
but on the TT it sais "No laser printer connected". Then it's easy to say
that the ACSI port is not 100% identical on the TT (even if the problem may
be a software problem, either in LaserBrain or in the TT-TOS)...

>FSM GDOS?

>BTW, does FSM GDOS work as a direct replacement to GDOS, like G+Plus, or
>do the programs which currently run GDOS, have to be modified to look for
>FSM?

No - yes - depends.

Goldleaf will supply FSM as soon as it is realeased by ATARI.
The price will be mostly to cover the licensing fee for fonts that will be
included with the FSM package.

In theory GDOS applications should work just fine with FSM, there
is a 'compatibility mode' in which you define the fonts and sizes you want
to use and FSM will precompute them so they act just like bitmaped fonts.

We have made some changes to Wordflair II to allow direct access to all
fonts and sizes (up to 999 point) as well as some display improvements
that are possible with FSM.

My guess is that you will see new versions of GDOS applications that
make use of the features of FSM GDOS.

Here in germany I am aware of 3 Pascal compilers, all commercial.
I have experience with the compiler of Prospero and I like him. As all
Prospero languages, Pascal is a complete development kit, including a
editor, compiler, library manager, source code debugger. The kit is full
integrated in GEM, well documented (in english :-) and conforms to the standard
(level 0, no conformant arrays).. Optional you can get libraries for 68881.
Prospero has distributor in the US.

I have no experience with the other compilers; all I know is that the doc's
are in german.

Ralf

P.S. Does anybody know, whether there is a company working on a Pascal compiler
for the new IEEE stamndard ?

3682. Shades of gray

Newsgroup: comp.sys.atari.st
Date: 1991-05-04 23:27:18 UTC
From: logajan@ns.network.com
Message-ID: <1991May4.232718.24140@ns.network.com>
Source record: 232492

I've been experimenting with increasing the number of shades of gray
that can be displayed on a color monitor (in low res mode, 320*200)
at the same time.

You can get 8 shades of gray with normal usage.

You can get 15 shades of gray with a two-screen flip/flop (flicker
graphics.) This, of course, requires two 32000 byte areas of memory
for the image data. A further complication is that "bright/dim"
pairs should be altered sequentially between the two screen memories.
The alternation pattern repeats every two lines.

If this is done, there is no noticable flicker in the 15 shades, although
you can see a stippled pattern moving up the screen if you let your eyes
track it. It is not that easy to track, though, so there is no significant
problem with it.

You can get 22 shades of gray with a three-screen flicker mode. (I tried
Howard Chu's suggestion of a two screen mode with one screen played twice
in a row, but the flicker generated was totally unacceptable.) Again,
the "triplets" alternate between the three 32000 byte screen areas. The
alternation pattern repeates every three lines.

The result is again (surprisingly) flicker free. Again there are diagonal
lines that can be tracked moving up the screen, and they are slightly easier
to notice because they move a bit slower than the two screen stipple pattern,
but again, there is no significant problem with it.

I tried a 29 shade four-screen flicker mode, but flicker was unacceptable.
I only tried one "quadruplet" alternation pattern, however, so there may
be something better to be tried.

In summary, 22 shades of gray are possible on a low res monitor (and consume
96k of screen memory) and look quite good, as a matter of experimental fact.

Sometime in the next few weeks(months?) I will post a 68k assembly listing
of a procedure which takes the starting address of a virutal screen image,
and renders a 320*200 22 grayscale window to the display, and returns to
the user when any keyboard key is hit.

> big way anyways.. ;-))

Well, I thought it would work that way, but ... \AUTO\AMCLITE.PRG
turned out to be an even bigger mess. AMCGDOS installs itself and
reads the ASSIGN.SYS file just fine, but as soon as the GEM Desktop
comes up and tries to open a window, I get a dialog box that says:

GDOS-Warnung:
Ihr Programm benutzt ungultige

[WEITER]

I don't know any German, but if I were to judge the meaning of
WEITER it would be ``Blow the entire system right to the moon.'' I
get a large number of bombs (too brief a display to count) and the
system reboots, leading to a repeat performance, ad infinitum.

I wasn't even able to get Supra's hard disk software to force-boot
from a floppy; the old control-shift-alt trick had no effect
whatsoever. (Is this a TOS 1.4 side effect?)

The only way out of it was to disconnect the data cable between my
Wren and my Adaptec controller, boot from the floppy disk, reconnect
the data cable and run SUPRBOOT.PRG manually, allowing me to get into
the hard disk and get rid of AMCLITE.PRG.

David P-Z has offered to send me a self-installing AMCLITE archive
... I'll try the setup that worked on his system and see if I can get
more Weiter-fireworks.

3684. FORSALE: ATARI ST HARDWARE - SuperCharger (IBM emulator)

Newsgroup: comp.sys.atari.st
Date: 1991-05-05 01:14:11 UTC
From: jtang@einstein.oac.uci.edu
Message-ID: <28235C63.9132@orion.oac.uci.edu>
Source record: 232465
Cross-posted to: misc.forsale,misc.forsale.computers,comp.sys.atari.st

I have an IBM emulator for ATARI ST computer for sale: Super Charger

Here's some spec.

1 meg RAM (if you are in ATARI, you can use this 1 meg as RAM DISK for ATARI)
NEC 8 mhz V30 processor (8086, 8088, and some 80286)
Can accept VGA card
Norton SI 4.4
Use ATARI mouse as PC mouse
runs '286 Window'
hookup via DMA port (daisy chain)

100% IBM compatible (so far)
Support ALL HD, serial, and parallel (that mean you can use ATARI's modem
and printer in your IBM mode
Support external Floppy, multi-sync monitor

Almost new. Used for ~2 month. (had it for ~ 6-7 mon.)

Bought it for $450 + tax + other junk

Want it for $350, or make me an offer, I need some $$$$

Include:

SuperCharger Unit
DMA cable
DOS 4.0
Manual
Original Box and flyers
"Power take off" (I don't suggest using it, just get another power adaptor,
any Radio Shake will have it, cost ~$5.00)

If you are interested, please send me a mail at

eapu087@orion.oac.uci.edu

or call me at

714-854-0257 and ask for James

> etc... does anyone know what library these are in? i have libm.a and dlibs.a
> in the directory.. (single floppy :-( ) anyways, thanks for the time!

They're macros, not functions. #include <osbind.h>. The preprocessor
will convert them go the appropriate GEMdos/BIOS calls.

Note that Sozobon adds a leading space to external identifiers,
so what it can't find is Bconin and C_conout.

(Proper spelling of the GEMdos console output routine is Cconout -- no
underscore after the C.)

Here's a simple term routine that uses only BIOS.

#include <osbind.h>
#include <keydef.h>

#define AUX 1
#define CON 2
#define KEY_UNDO 0x6100

term()
{
register int c;
register long d;
while (1){
if (Bconstat(CON)){
d = Bconin(CON);
c = ( (d & 0x00FF) | ( (d>>8) & 0xFF00 ) );
if (c == KEY_UNDO) return;
if (c) Bconout(AUX,c);
}
if (Bconstat(AUX)){
c = Bconin(AUX);
Bconout(CON,c);

}
}
}
```

Well harumph!! I never got such information from ICD (I am a registered owner), and I got the impression from the last time I called them that they were not putting any more time into it. I stand corrected, and will contact ICD asap for my new copy. Thanks for pointing it out.

>Just out of curiosity, why would a British company last any longer than
>an American of Canadian company? ICD is a solid company that supports
>all of its products. They are also a thriving company.
>

Because american ST software folks are getting fewer every day. The number of great products that no longer have support because of bankruptcy is rather large, and is a shame. From the british ST magazines I read, I do not get "The end is near" type impressions that I get from US based publications. I see neat new hardware/software being offered, with large full color ads. In the US, I keep getting "Sorry, we do not support the Atari ST" over the phone (if the phone number still exists, that is). Just a couple off the top of my head:

Mark Williams C - no more support, working on Coherent
Wordup 3.0 - Company bankrupt
Timeworks - No longer updating US versions (but are still updating UK ones).
Michtron - pushing up daisys.
. . . . .
. . . . .

Now, when I sink money into a professional application, I make sure that it is
a. European, or
b. Selling well in Europe.

Obviously this is IMHO. If I did not state this in my original post, it was a booboo. Also, I wish to note that stateside utilities seem to be better

than what is offered elsewhere (Neodesk, the Codeheads, UISIII, etc).

Implicitly I am referring to the one which also exists on ST systems, which is
the ASCI one. Are you telling me to be more up to snuff on my technical
descriptions? Crack open an ST or TT manual sometime, and get your red
pen out . . . .

>
>In any case, you are mistaken. A working setup on an ST will work fine on

>will be accessible and will work just fine.
>

Wrong.

<sigh> Here we go. Ok Allan, here is exactly what happened (for the third
time :-).

A working ST system: Mega4, laser printer, Supra Hard disk. The SCSI
drive contained within the Supra is set to SCSI id 1. The ST does
not mind this at all. Everything works.

A TT system is purchased.

The DMA cable connecting the Supra to the working ST setup is disconnected,
and attached to the ASCI DMA port on the TT.

The computer is booted.

The Supra is invisible to the TT desktop, for no apparent reason. Nothing
is stated in the manual. No error messages from the HDX software.

What was really strange is that the Atari formatting software could see the Supra (and it was later used to format and partition it, to no avail). However, nothing could make those partitions show up in a window on the desktop. This was finally fixed by tearing the Supra apart and setting the SCSI disk contained within to SCSI id 0.

The question WAS: why did this have to be done? It worked fine on the ST when set to SCSI id 1.

Please do not answer this question. I don't care anymore. Nobody cares anymore. All of us that read all this bandwidth will carry the "set it to zero and try it" solution for the rest of our days. We will repeatedly tell new TT owners this when they post the "what the hell is wrong with my hard disk" question on c.s.a.st. This will just become one more such tidbit of information that is needed to have success with ST/TT's, and is not printed in the manuals that come with the computer(s).

Dudes, and dudets

I am on a quest!! I am interested in finding an gif viewer, like viewgif, but it should be able to access the 4096 color pallet of the STe the MegaSTe the TT and the 4096 upgrade for the 1040st from JRI.

If you know of one, or know how to make one, please leave me a note....

Hmm, since I have Tos 3.01, maybe someone could tell what needs fixing in it ?
As I remember from the list of patches to Tos, there were a patch specifically for
Tos 3.05, but none for 3.01... maybe they just added a few bugs to ver. 3.01 and
released it as Tos 3.05... :-)

```

When you tell GEMDOS to Fopen("AUX:",2 /*read/write*/), it will return
0x0000fffeL.
This is the "device handle" for the serial port; it's WORD-negative, but
LONG-positive (BTW: this is _not_ the same as handle 2, which can be
redirected; device handles can't be redirected !).

I think that GCC's fopen() mistakes this for an error code.
Most (if not all) GEMDOS function return LONGs; in particular, the Fopen()
and Fcreate() system calls should always be treated as returning a LONG.

GCC's Fopen should do something like this:

```
long err ;
int handle ;
err = Fopen(fname,2) ;
if ( err < 0 )
{
return (FILE*)0 ; /* ... open error ... */
}
else
{
handle = (int)err ;
}
```

I suggest you try to find & fix it in the lib sources...

Martin Koehling

Hi. I've just been fiddling with gnuemacs and mint08 myself.
What I basically did, was :
1 grab the source from atari.archive
2 remove most of the #ifdef atarist
(to get multiprocessing and so forth.)
3 compile
It seems to work allright, I can run compile.el, and it starts a compilation in the background,
just nicely. I can fork shell commands, I can suspend emacs, it's all there except one thing :
I haven't been able to "dumpfix" xemacs, (Make a final dumped emacs) so I have to use temacs -l loadup.el, whitch is no big deal if you have a TT, but on an ST....

> Mark Williams C - no more support, working on Coherent

This isn't new. It's been like this for a while. BTW, what about Turbo C and all the other compilers? Because one company bails on the ST market doesn't mean the US market is doomed.

> Wordup 3.0 - Company bankrupt

Who's going to buy a buggy, slow program? You? Me? That's why the company's bankrupt. BTW, I've heard Atari picked up WordUp 3.0.

What about all the other word processor support? WordPerfect? Goldleaf and Wordflair? DTP: Pagestream? They're all US companies and are doing pretty well in the ST arena. However, I'll agree that the ST is lacking a good word processor, on the lines of Word for the Mac. We'll see what happens with Wordflair II. Anyone want to post a demo of it at atari.archive?

These SIMMS are compatible with any Mac. If you have an SE/30 or any Mac II with only 1 meg of RAM, this is the most inexpensive way to get a second meg.

3704. Which monitors can use TT high res?

Newsgroup: comp.sys.atari.st
Date: 1991-05-06 01:01:00 UTC
From: yegerleh@vivaldi.ecn.purdue.edu
Message-ID: <1991May6.010100.9329@noose.ecn.purdue.edu>
Source record: 232356

Dear Netters,

I know that the TT has a really high-res mode (more than a 1200 by
600? pixels), and I know that Atari is (or will be) selling a
monitor which takes advantage of it. My question is, is there
a reason why only Atari's monitor can be used with the TT high res,
and if so, is it available and how much does it cost? Also, i
don't know anything about video signals, so please translate
into simple terms, please!

I am looking real hard at getting a new machine, and the TT looks
real nice, and since I plan on doing DTP and CAD, I would really
like to have the high res. I was looking at PC stuff in Computer
shopper, and to be honest, I was amazed at how common
place and inexpensive are these new "Super VGA" 1024 X 768 X
256 colours monitors/video cards. You can get the card and
14" monitor for <$400. Plug that into a cheap clone, and you
have a nice system. It's very tempting, since the TT is a bit pricey.
It's just a bit disappointing that the best the TT has is roughly
the equivalent of normal VGA. One of the things that attracted me
to the ST back in '86 was the beautiful 640x400 mono, better
than anything that existed for the PC at the time (EGA).

Any answers are appreciated. I am leaving for the summer
tomorrow to go to my summer job, so I probably won't see
any responses for a few weeks, since I'll have to dial up
my purdue host long distance. Thanks in advance,

Jim

From: scale@abode.wciu.edu
Message-ID: <1991May6.010821.1551@abode.wciu.edu>
Source record: 232352

Hi Jonathon,
I too am a avid CodeHeadian! What you said about many of the programs and features of the CodeHead Utilities Disk, being duplicated on the latest versions of HotWire and MaxiFile is very true. Although having these features as a part of HotWire and MaxiFile, will save a little memory if you ran them all seperately. I use most of the available CodeHead software, and I am very pleased; and yes, it does help to have 4m's of RAM. =^)
John and Charles have mentioned that most of thier latest software updates will stay as they are for a while. The next upgrades will be for the CodeHead Demo Disk and the CodeHead Utility Disk. Many of the programs currently on the CodeHead Utility Disk will not be on the new utility disk (because many of them have been incorporated into HotWire and MaxiFile). They have several new programs in the works; including updates to Art Gallery and several others. Bye.....

It definitely should work with no problems.
If you have Spectre 3.0, you can use Mac-formatted cartridges directly.
It should work with TOS also.

And a call to MWC has confirmed that it is still like this. Why? Hmmmm . . .

>BTW, what about Turbo C
>and all the other compilers? Because one company bails on the ST market
>doesn't mean the US market is doomed.

Turbo C is a German product. Borland would not produce an ST compiler. Borland also recently "took away" their name from the product (according to a recent post to c.s.a.st).

>
>> Wordup 3.0 - Company bankrupt
>
>Who's going to buy a buggy, slow program? You? Me? That's why the
>company's bankrupt. BTW, I've heard Atari picked up WordUp 3.0.

Me. I just bought a used copy of the last upgrade. I find it to be a fine program, with the most usable dictionary/thesaurus I have used. I feel that this product was headed for greatness before the company got hacked.

>What about all the other word processor support? WordPerfect? Goldleaf
>and Wordflair? DTP: Pagestream? They're all US companies and are doing

>a good word processor, on the lines of Word for the Mac. We'll see what
>happens with Wordflair II. Anyone want to post a demo of it at atari.archive?
>

Wordperfect - have you glanced at the PC version lately? I would not call
what WP has been providing the ST version "support". A few bug fixes every
2 years is what I would call it . . .
Pagestream - a fine product, which I own and use (I didn't say it was all
bad, sheesh :-).
MS Word for the Mac - the closest thing I have seen is Wordup 3.0 (In it's
last update). As a matter of fact, I prefer Wordup.
Wordflair II - I could be totally mistaken, but I believe Goldleaf is a
British company.

Ok, flame off. Perhaps my prose gave the impression of ST doom in the US.
This is not exactly true. I just think that the ST will never have a huge
user base in the states. Atari has blew it too many times for this. However,
it does have a small user base, the best PD software quality I have seen
for any system, a few niches (music, small DTP stuff, PIP Copy Centers),
some great graphic demoes (with more every day), some of the best games known
to man, and does have a selection of robust powerful applications. Call me
weird, but I kind of like it this way. Less stuff to wade through, and the
gems are easier to find.

However, the "robust powerful applications" I am referring to get that way
through company support. What I suggested in my previous post is that a
european company (producing a professional product for the ST) would be more
likely to be around for the duration. May I point to MWC as an example? It
was/is considered one of the better C offerings for the ST in the states. Why
then was it taken off the update list? I bet Prospero sells more copies of
their compiler in europe than MWC does here. That is why I will buy Prospero
C instead of MWC.

I still recommend that anyone getting ready to put $80-$100 in a
compiler to purchase Prospero, or Turbo, or Lattice, or any of the other
european compilers over Laser, MWC, Personal Pascal, etc. I happen to like
upgrades and updates :-). Of course, if an American product is better, and
looks to already be stable, and does not inherently require lots of company
support, I will buy it (mom, apple pie, etc). Just trying to protect my
$$$$$.

The above and the previous post was IMHO. Have a nice day.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I wrote:

>>Check out what TimerB, C and D do, check Internals (though from memory
>>there was a bug in that part :-( ), or grab play.arc from atari.archive
>>and look for the interrupt code that writes to the Yamaha chip.

I'd like to appologise to Dave for seeming to suggest anyone use his code.
I meant only to indicate a place to see interrupt code. I was talking
about the couple of lines of hand waving the systems requires - you have
to reset interrupt pending flags or something. The last thing I would
suggest is for someone to grab Dave's code verbatim - or grab anyone's.
Nobody learns anything by just copying code.

Now, to write a Timer A interrupt:

Use the XBIOS function Xbtimer to set the vector to your handler.
Your handler should:
1. Save and restore ANY registers it uses.
2. Before you exit, clear bit 5 of $fffffa0f, the Interrupt in-service
bit for timer A.
3. Exit using RTE

That, I think, is the bare essentials. Dave would nodoubt do exactly that.
So would any other program used Timer A.

Hello,

I think, that their latest Version supports removable media, because they also
sell a SyQuest-Drive.

Their Address is:

GE-Soft
Habsburger Strasse 13
5216 Niederkassel-Rheidt
Germany

This is what they say, when I phoned them:
- They where really surprised that there is someone in America who uses their
product.
- The latest version ist 3.2 and you need this version if you want to use
a removable media
- They have a distributor in America
Rio Datel
Flamingo Route
Las Vegas
Mr.: Richard Ollins

I couldn't get the fonts to work with AMCLIGHT, GDOS1.0, GDOS1.1 or
G+PLUS. I can get other programs (eg, Microsoft Write) to run and
use any GDOS-based fonts, but not GEMINI. Any thoughts?

Source record: 232363

Hi there, y'all!

You have to put AMCLITE.PRG into the auto-folder. Then put ASSIGN.SYS into
the root directory. Get your hands onto you editor an open ASSIGN.SYS for
editing. Somewhere in it you'll find a PATH saying e.g. C:\FONTS\ .
Change this one to the path where you store your GDOS-fonts. Save it.
Rebbot. if it won't work, remove all programs and acc's from either the
auto-folder and the root-directory (all but AMCGLITE.PRG). Reboot.
On each reboot, add one of the removed file until you get the Window
saying 'WARNUNG! Ihr Programm benutzt ungueltige ..'
The kind of GDOS-programming in tihs program is done by dirty tricks. It
won't work with AMCGLITE.PRG because it doesn't uses the correct GDOS-
standards. Try to get a newer revision of that program.
Hope that'll help

(1) GDOS can only be run from within the AUTO folder. Unfortunately, AMCLIGHT forgets to check for this.

Don't blame Gemini or AMCGDOS for this. IF there is a bug, it's in
the harddisk driver you use.

>
> ----
First of all, you can use any other GDOS (or no GDOS at all). Try the
older AMCDOS-UK version that should be available from some servers.

Then, you should remove all accessories and try to find out, which one
is causing the problem.

To make it clear: the only problem with AMCLIGHT is the scrambled, german
error message!!

3716. Cal 4.7 - problems with 'save'?

Newsgroup: comp.sys.atari.st
Date: 1991-05-06 11:59:50 UTC
From: marc@uni-paderborn.de
Message-ID: <1991May6.115950.4773@uni-paderborn.de>
Source record: 232367

I unbundled the nice 'Cal v4.7' tool (posted in c.b?.atari.st some
time ago). It's really nice, and I would really like to use it.
But then after playing around with it a while I decided to enter
my personal birthday list. I did it and then I left the program
with asked me to save my changes. Well, I pressed the [save] button,
and expected the file select box to come up. But, instead ...
...?
...?
... nothing happened. Nothing! The program hung. I waited some rather
long time (perhaps this nifty thingy has to clean up its tables after
entering quite a lot of new data? - I thought) but... nothing. I finally
(siiiiiiiiiigh!) pressed Ctrl-Alt-Del. I hoped it was a single effect
and would never return again... I started entering my birthday list again,
saved some times in between, all went well, but... half way through...
save failed again with the same behaviour. I was rather annoyed.

I like that program (no, really, besides that effect, at least). The
author left no e-mail address (and I'm too lazy to write postcards...
perhaps I should, yep). So, anyone else out there with the same problem?
I think I did have no spectacular environment, but, to be sure, something
like: 520 ST+ (1MB) monochrome, TOS 1.4, CardFile, Rho Control Field and
Cal 4.7 as ACCs, Desktop Picture (v. Kruysbergen?), Vortex HDplus 30, ...

It would really be a pity if I couldn't use that nifty program just
because of some stupid misbehaviour like this...

Any ideas? Is the author reading this? (forgot your name, boy, my ST's
at home)

Hopefully waiting,
Marc

3717. Drawing, plotting, ...?

Newsgroup: comp.sys.atari.st
Date: 1991-05-06 12:11:44 UTC
From: marc@uni-paderborn.de
Message-ID: <1991May6.121144.4862@uni-paderborn.de>
Source record: 232369

As I decided to give my poor old ST yet another chance to be
treated as a real, usable, reasonable, adult computer, I'm looking for
(possibly from the PD realm...):

(a) some kind of vector oriented drawing tool, like
good ol' Gem Draw (perhaps improved?) or something like that.

(b) some plot program that could plot x-y (or better
x-y1-y2-...-yn) style data files and, if possible,
function graphs. Or, put it this way, is there a
decent port of Gnuplot running on a 1 MB monochrome
ST available? (Think I read something like that somewhere...)

Any hints where I should start ftp'ing? :-) Or any good (i.e. student
friendly prices) commercially available products I should look out for?

Thanks from my '86 ST...
Marc

Bingo! Florian wins the prize: It was, indeed, a desk accessory. I'm
not sure which one, but I suspect the (very old) CALC.ACC or Notepad!.ACC.
I'm up and running now with Gemini Bold 9pt.

Well, I don't know about the STe, but I never really had a problem
with character buffering (I type about 50 wpm). However, this does
remind me of a couple annoying features.

1) Related to character buffering, if you hit two or more <RETURN>s
quickly, it won't register some of them. (Never had this problem with
characters though, so I don't know why this happens.

2) Clicking on the Down/Up scroll arrow, it isn't automatic. You must
click once for each line to move. Needless to say, I never use this,
I use the slide for scrolling.

I used WordWriter several years ago, and like many of the ST word processors of the time, the character buffering seemed very annoying. At times I had type ahead, then it would go away, and just didn't flow very nicely. Someone had told me that this had to do with the architecture of the keyboard interface.

Is this still true, or was it ever an accurate description of the way these things work? I have a very old 1040, and plan to buy a new 1040 STe within the next month; will this change things?

>writes:
>> I unpacked and installed GEMINI from comp.binaries.atari.st last night
>> after only a moderate amount of muttering and cursing about LZH. However,
I'm having problems with ANYTHING that uses GDOS (I use G+PLUS) so I
didn't expect it to work with Gemini. :-(.

My problems with Gemini are relatively solvable so I won't
mention them (I'm running TOS 1.0 %-0) EXCEPT -->

1. Is there any way to get Mupfel (Since i have TOS 1.0) to boot the
Venus program automatically ??? I could get the older version of it to
do that but the newer one blew up in my face.....

2. That Tree* program LOOKS great but blows up my computer EVERY time
I attempt to use it. With or without Gemini. I don't recall seeing
anything in its docs about required TOS versions....

3. How do I add icons to Gemini ?? I've done it using a resource
editor but the small and large icons don't quite measure up/match
(meaning --> If I make a large icon and a small icon for the same
program to use, how do I put them in the resource so that they line
up when assigning them to a file ?)

I really like the ability to use overlays since with Mupfel & Venus
both running I only have 450K free. Overlays make life a whole lot
easier. ANd being able to run ACC's from the desktop....

One other thing.....
That Chmeleon.acc in the distribution doesn't like wm.arc (Wholly
Macro) that's at atari.archive.umich.edu in atari/printing (?). It
loads it but then can't unload it..... had to reboot.

From: sievert@gypsy.ims.fhg.de
Message-ID: <70@gypsy.ims.fhg.de>
Source record: 232373

Hallo!

I posted a cry for help some weeks ago in atari.st.tech. That area is
corrupted since - looks like it's been a difficult question. ;-)
But so I have to mail this here.

Q: The SH204 controller accesses my ST251 HD-drive after the HD has finished
it's selftest. It's not the Atari, it's the controller, as the Atari does
not have to be connected. What does the controller look for on the HD?
None of my friends (most of them use IBM's) has any idea.

I ask, because this first seek often fails and the HD will not be accepted
by the controller. HD runns fine in an IBM.
After a successful start, it also works fine for me.

-Clarance

I updated to Gemini version 1.21 from the code that was just posted to
comp.binaries.atari.st. I tried AMCLIGHT.PRG and it worked fine, but
I think it does have to be run at boot time. Your problems are most
likely with the ASSIGN.SYS file. You have to make sure that the path
listed at the top is correct and that the fonts you give all exist.

I did run into trouble when using the font BAGE09.FNT with G+PLUS. It
was distributed in Motorola format instead of Intel format.
AMCLIGHT.PRG apparently accepts either format, but G+PLUS gets all
confused. Without realizing what the problem was, I tried fixing it
with FONTZ. FONTZ reads it in okay but for some reason, it changed
the "bottom" parameter from 3 to 4 in the font header. I finally went
in with a file editor (XXED) and patched the output from FONTZ and now
have a working font.

By the way, I am running on a Mega-4 under TOS 1.4, using a Supra
drive and software.

Even if there is no drive 0 in the working chain of drives attached to
the ASCI port? ie, my ICD drives, with ASCI to SCSI adapter and drives
with SCSI id's 2 and 4? (I havn't the foggiest what ASCI id they (it?)
would have, from previous disclosures, I understand I can have an ASCI
id 0-7 for 8 different host adapters, and 0-7 SCSI id's on each?)
naw... I thought the host adapter was "transparent" and the SCSI id's on
the ASCI attached drives became the ASCI id.

Conjecture: My two drives (SCSI id's 2,4 on an ICD host) would show up
as ASCI id's 2,4 and work just fine (With ICD's software) attached to a
TT.

>Opinions expressed above do not necessarily -- Allan Pratt, Atari Corp.
>reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

John Cummins
(still wondering IF there's a problem with NOT having an SCSI ID 0 on a
chain of host adapter equipped drives attached to an ASCI port on a TT)

You can *almost* do this with Arcgsh 3.5: Install Arcgsh as a desktop application for *.ZOO files, doubleclick on a Zoo archive and you are presented an options dialog. Here you simply select the "extract" button, click on "OK" and your archive will be extracted.

This works the same for Arc and LHarc archives, and even for uuencoded files.

3725. TT & HD on DMA/TT & UNITERM

Newsgroup: comp.sys.atari.st
Date: 1991-05-06 16:12:09 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <24289@know.pws.bull.com>
Source record: 232376

Re: TT and hard drives. I had a problem with the TT (and MegaSTE) not recognizing an ICD drive on the DMA port. I called CS&S in Toronto (they sell ICD drives to dealers) and they told me to take off the parity jumper on the drive. Once I did that, the TT and MegaSTE recognized the external HD.

Re: UNITERM on the TT. It works, but it only uses 640x400 pixels on the TTM195. On the PTC1426, you can set the rez to ST high and UNITERM works fine.

3726. Postscript Converter for 1st Word +

Newsgroup: comp.sys.atari.st
Date: 1991-05-06 16:23:16 UTC
From: csual@warwick.ac.uk
Message-ID: <HFJ_&&^@warwick.ac.uk>
Source record: 232378

I seem to remember a discussion a while back about PostScript converters but I never followed it at the time.

However, I've just been given an assignment and the lecturer insists on everything being laser printed and I don't have one of those! What I want to be able to do is write the docs etc with 1st Word + on my ST, save the output in PostScript format, and then I can stick it on the laser here at Uni.

I have had a few ideas like using barrel.prg and a PostScript printer driver, but I haven't looked closely to see whether either can do the job!

Any other ideas would be appreciated, as I can't be bothered to learn nroff!

Jas.

I helped to beta test the program. For one thing, when you say "save", it does not immediately write to the disk. What it does is save THAT particular event into it's database uniquely. If you hit "repl", it replaces the one you edited with the new one. Only when you exit the program does it actually save to disk (after asking you).

I have a real funny feeling that it is something else in your setup, or that it was working fine but you did not understand what it was doing. I am getting ready to post the latest version (5.0), which has a rewritten manual. I suggest you get it from atari.archive (in a couple of days). In the mean time, why don't you try putting it on a floppy and running without any auto or other acc's. I am unsure if the program locked up, or just did not "save" the way you thought it should (from your above description). If it is the second, the program was working fine (you just need to exit all the way out for it to write to disk, after all editing is done). If it is the first, I would say it is another acc or something. Personally, I use it renamed as

a .prg, since I don't trust accs :-).

>

> ST available? (Think I read something like that somewhere...)

I have several great programs for this. First of all, you can try SubCal 1.14 on atari.archive.umich.edu. It is primarily a calculation tool, but does support graphing. Now, here is my problem. I have two tools from magazines. They are Sci-Plot and Ultra-Graph. Either one would be ideal for what you want (Sci-Plot is probably better, as it is more printout oriented). However, I am unsure if I can put them on atari.archive. Does anyone know? One of the magazines is dead (STlog), so would that one be ok? Is STart dead yet? Here are the issues:

STart November 1988 - Sci Plot
STlog November 1988 - Ultra-Graph (geez, that's weird!! I never noticed the identical dates before?!?)

Anyway, if you can find the back issues with disk, you have got it made. Otherwise, if someone can figure out a way that I can legally put them somewhere, let me know.

Sci Plot is geared toward making professional graph printouts. They come out looking great, and it is very flexible in terms of data input, graph type, error bars, placement, text on the graph, etc.

Ultra-Graph is more of a screen oriented function plotter. It is absolutely stunning on a color monitor (I remember many days of dinking with this one when I got it). Also looks nice in high res. It can do 2D stuff, but it was really designed to show 3D plots. You can move your point of perspective, enter your own functions, change colors, etc.

>None of my friends (most of them use IBM's) has any idea.

The Adaptec tries to read the disk's format from the drive itself. The
format data must have been written onto the drive before, of course. This is
done when formatting the drive.

After reading the disk format, the controller seeks to 18 zones on the
surface of the drive.

> (meaning --> If I make a large icon and a small icon for the same
> program to use, how do I put them in the resource so that they line
> up when assigning them to a file ?)

Well, I don't really understand this question because, in Gemini, there is no need for a small icon to line up with a large icon. Gemini can display either large or small icons...but *not* both on the desktop. If you take a closer look you 'll find out that there are 2 seperate trees in the resource file GEMINIIC.RSC, one for large icons and one for small ones.

Perhaps what you 're trying to do is to mix large icons with small icons _inside_ the same tree. Although you are free to do something like that it is quite messy and IMHO will make Gemini's desktop look awfuly inconsistent.

The "right" way to add icons is the following:

1. use any resource editor that accepts icons (the PD MKRSC.PRG doesn't)
2. open the file GEMINIIC.RSC
3. open the 2nd tree (it's the one with the large icons)
4. Now if the resource editor provides a way of sorting objects, you can add the new icon anywhere in the tree otherwise I suggest you add it as the last object in the tree.
5. Sort the tree (if this feature is provided by the editor)
6. close the 2nd tree
7. open the 3rd tree (it's the one with the small icons)
8. repeat step #4, being carefull to place the new icon at the same point you placed the corresponding large icon in the 2nd tree. (i.e. if you put the large icon as the 5th object in the second tree, you _must_ put the corresponding small icon as the 5th object in the 3rd tree)
9. repeat step #5, being carefull to sort the 3rd tree in the same way you did with the 2nd tree.
10. close the 3rd tree
11. save the modified file
12. close the resource file

The whole process seems tedious, but I think that the fact that Gemini supports variable-size icons makes it up.

whaoo...the article turned out to be longer than thought..I am sorry

I have a the ST port of gnuplot, but the screen driver is not very good.
Also, it is command line oriented and produces mediocre printer
ouput, even though it supports postscript. I have tried several other
PD plotters, but they are generally disappointing.

[stuff about Sci-Plot, Subcal, and Ultra-graph]

|> Sci Plot is geared toward making professional graph printouts. They
|> come out looking great, and it is very flexible in terms of data input,

I have had Sci-Plot for a long time. It is great, but is basically
worthless to me for one reason. It cannot produce high quality
output files. Plots can be saved as DEGAS pictures, but that is the
best it can do. I need GEM metafile or postscript output.

|> Ultra-Graph is more of a screen oriented function plotter. It is absolutely

Does this thing plot 3D DATA (not just functions)? Does it produce
resolution independent output? If so, I want it.

There is some commercial graphing software called FirstGraph which
produces GEM output files, but I have been unable to find the demo program.
I refuse to purchase it until I can try it out. Does anyone know where
I can get this demo?

My understanding is that the ST will read ID numbers from the lowest one to the highest, and it doesn't matter if some are skipped. The TT reads from 0 up in SEQUENTIAL order. If you skip a number the others are invisible. If your TT doesn't have an internal HD then the ID 1 drive would act as you described and changing it to 0 would be the fix. Does this make sense or am I all wet? (I don't have a TT so I don't know if the manual says this. I picked it up somewhere, on GEnie maybe.)

With TOS 1.4 you shouldn't press SHIFT-CTRL-ALT (or is that CTRL-ALT-SHIFT?)
until the floppy light comes on the second time. Works every time for me...

>> And what about G+Plus? Will it make my ST run faster and jump
>> higher? Can I continue to live without it? I've seen it
>> favorably mentioned on the net, but I really don't know what it
>> does.

G+, basically does what GDOS does, only better. It lets you install a different ASSIGN.SYS file for different programs and load different fonts for different programs, etc. It doesn't load all the fonts at bootup like GDOS does, thereby saving RAM space until you run the program that _uses_ GDOS.

re. CodeKeys, if I had to give up all but one, I think I'd keep CodeKeys as it lets you automate any operation to a key stroke. Link files let you have a different set of macros for each program, and one macro can load another set so the number is not limited to 32. It's equivalent, in my opinion to Quickeys, which I just got for the Mac II I use at work. I paid $98 for Quickey, because I have learned how valuable macro keys can be by using CodeKeys, @$40. It's a bargain.

3736. Using ST hard disks on TT's

Newsgroup: comp.sys.atari.st
Date: 1991-05-06 19:04:33 UTC
From: apratt@atari.UUCP
Message-ID: <2928@atari.UUCP>
Source record: 232316
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

A couple of people have written to me complaining that their TT's only see the first four partitions of the hard disks they were using on their ST systems.

The answer to this problem is always the same: the driver is different.

Supra (and ICD?) use tricks that we don't use to get more than four partitions on a drive. We use a different trick. When you attach a drive with more than four partitions to a TT, you are using the hard-disk driver from Atari which is on the TT's internal hard disk, not the driver that understands Supra's trick.

Since these drivers probably don't work on TT's and certainly don't know about the TT's SCSI port, you are stuck. You should copy all the data off of the Supra drive, and use the HD tools that come with the TT to reformat and repartition it. These tools will let you create more than four partitions, but they'll do it the Atari way, not the Supra way.

It is possible that HDX will not be able to format your drive, because it can't tell how big it is. HDX can always tell how big SCSI drives are (that is, drives on the SCSI bus), but it can't always tell about ACSI drives. It might ask you what type of drive it is, with a menu of drive types to choose from. In either of those cases, I can't help you -- I don't know which type to choose for the various Supra drives.

Good luck.

3739. USENET mail order service???

Newsgroup: comp.sys.atari.st
Date: 1991-05-06 19:45:51 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <kc9P9j600VAyI12EVd@andrew.cmu.edu>
Source record: 232394

Dear Netters:

I have recently been toying around with an idea. I have the facility to get most current ST software and hardware at wholesale, and was thinking that maybe, since there are so few dealers of ST stuff lately, and not everyone subscribes to STart or some other source of mailorder advertising, that I might offer a sort of USENET ST mail order service.

Question: Does anyone think this goes against USENET ethics about commercial advertsing, etc.?
Question: Would anyone be interseted?

This is all legal software, obtained legally, and above board. I even have a sales tax number, etc. All involved parties are reimbursed, both distributor and software publisher. My prices would be about 30%-50% below the suggested retail, and around 10%-15% below mailorder, as I am not doing this to make heaps of money, just to try and get some ST stuff out there. Also, since relatively few ST owners also have access to the Usenet, I do not think I will be taking business from the mailorder houses, or dealers, or else I would not do this.
Please respond to this account with any opinions. If there is no, or very little, objection, I will post a "sign post" in a short while, after the responses start to peter out.
Thanks in advance to all who respond.

Prospero Fortran is ANSI X3.9-1978 compatible. The arithmetic is IEEE format, but doesn't work like IEEE says it should - the fraction seems to have one less bit than it ought, and there are some other quirks. I discovered this by running PARANOIA, which I got from NETLIB. A limitation I encountered was that a program unit couldn't have more than 32k of instruction space.

3743. "Install Application"

Newsgroup: comp.sys.atari.st
Date: 1991-05-06 20:23:34 UTC
From: glens@natinst.com
Message-ID: <22871@natinst.natinst.com>
Source record: 232386

Is it good practice to Install one application for many different
file extensions ? (such as a text editor for .c .s .doc .txt)
Also, can you Install a new application for an extension that is
already used for a different application to "deinstall" the old one ?
And finally is there any limit to the number of applications you
can have installed ?

Thanks.

I think if you wait until the floppy lights flash the second time, THEN hold
ALT/SHIFT/CONTROL, Supra will force boot under TOS 1.4. Seems to work for me.

Robert_Osten@hb2.maus.de (Robert Osten) writes:
>First I have to point out that the 'KAOS 1.4.2'-Fixes are copyrighted. So an
>upload to atari.archive is illegal !

That's a laugh! This kind of thinking doesn't seem to have occurred to the
KAOS people. I believe it is a derivative of a copyrighted work, and
therefore an infringement of Atari's copyright on TOS.

>So if you'd have any problems
>with other programs you can't claim any support services, especially
>from ATARI!

Correct. You can't expect support from Atari if you're using a non-Atari,
illegally-derived operating system. It is also the case that, in general,
trouble with "other programs" should be handled by the other programs'
manufacturers, not by Atari.

I conclude that the Supra controller responds on the ACSI bus using the unit number of the SCSI drive connected to it; see below.

> A TT system is purchased.
> The DMA cable connecting the Supra to the working ST setup is
> disconnected, and attached to the ASCI DMA port on the TT.
> The computer is booted.
> The Supra is invisible to the TT desktop, for no apparent reason.
> Nothing is stated in the manual. No error messages from the
> HDX software.

I stand corrected. I should have said, "A working system WITH ATARI DRIVERS will work when plugged into a TT." What is happening here is that on the ST, you are booting with Supra's driver off the Supra hard disk, and on the TT you are booting with Atari's driver on the TT's internal hard disk.

Supra's driver will find ACSI units which are not connected in consecutive order starting with zero, and Atari's driver won't.

The same thing would happen if you connected an ACSI drive, as ACSI unit zero, HINSTALLED with Atari's driver, to the ST: you would get Atari's driver, not Supra's. (Of course, since you now have consecutive ACSI unit numbers starting from zero, your Supra would be found; if the Supra were unit 2, it would not be.)

There is another problem which has been called to my attention, and which is covered by the same "Atari drivers" caveat: Supra uses one trick to get more than four partitions per drive, and Atari uses another. If you have a drive partitioned with Supra's trick, and you connected it to a TT (or any machine running an Atari driver) the partitions after the fourth one will not be accessible. Again, it's a question of using non-Atari drivers.

Hmm... Maybe I don't understand the answer, but I've had both large
and small icons on the desktop. Not in windows, of course, but definitely
outside of them.

Thanks for the explanation of how to edit icons. GEnie has a couple
of files of add-on icons. Unfortunately, I don't think you can combine
*.RSC files with the Mark Williams resource editor, which is the best
of the three I have. Are others more flexible?

Now, if I could just figure out what a compiler is supposed to look like...

3750. One Last Wish

Newsgroup: comp.sys.atari.st
Date: 1991-05-07 00:36:49 UTC
From: dddean@bluemoon.uucp
Message-ID: <3VwJ23w164w@bluemoon.uucp>
Source record: 232419

Hello:

I have been a user of the News Net for some time, and I know that whenever someone posts somethig totaly irrelevent to the sig that he/she gets flamed something fierce!

That is why I am donning my fire-proof suit to make this little post. It is one that I doubt anyone will flame me for, but I thought I'd be safe.

You see, there is a seven year old dying, and his one last wish was not that he get everything that everyone wants, but instead is a fairly reachable goal. I think that if you were to comletely read what I am going to show you; you too will agree.

The following is a text file that I found very touching, and thought that others could help out:

LAST WISH

A brain tumor is cutting short the life of seven-year-old Craig Shergold. His Last Wish doesn't seem very much to ask; simply that he receive some Get Well cards---hopefully enough to break The Guiness Book of World Records. If everyone reading this message could send him a card (or several!) and post this note on any bulletin boards or in any publications he/she may be in contact with, or even word of mouth, surely Craig's Last Wish will come true.

Send your card(s) to:

Craig Shergold

c/o Children's Wish Foundation

Suite 100

3200 Perimeter Center E.

Atlanta, Ga. 39346

P.S. If you are a person who believes in prayer, a prayer for this young man may, perhaps, find its way into another Book---and who knows?

He may just get a Get Well "wish" from someone else.

Please, if you can, send him at least ONE card. I know about the vastness of the net, and I think that we can all fulfill this young man's wish.

To do this, would be a kindness that eveyone can show!

Thank you for taking your time and reading this. Maybe some of us can relate to this. Maybe others can do more to help... who knows...

You can send any replies to:
David D. Dean, President David D. Dean, Vice Chairman

MENU+.PRG came with a METACOMCO macro assembler I bought, but I prefer
a cli, and I don't program in assembler anymore anyway. It is excellent
if you don't like cli's, because you can set up any configuration of
menus. Something like ARCSHELL for example could be done in a few
minutes.

Do they still have no plans to port 5.0 (or 5.1)? Until they do, I'll
happily use MS Word under Spectre GCR. I bought a copy of WP for Atari,
WP 5.1 for DOS, and MS Word for Mac. I just use the one that works well.

In article <22871@natinst.natinst.com> glens@natinst.com (Glen Sescila) writes:
>
> Is it good practice to Install one application for many different
>file extensions ? (such as a text editor for .c .s .doc .txt)

I do it with NeoDesk, and I'm sure the normal desktop will allow it as well.
On the desktop though, you'll have to edit the DESKTOP.INF manually in
a text editor. I recommend installing one application, then loading the
DESKTOP.INF file into a text editor, and copying the format it uses, but
using a different extender. Gee, I might as well just show you here. The
following is a sample of the end of a DESKTOP.INF file:

#G 03 04 C:\EDITOR\EDITOR.PRG@ *.S@
#G 03 04 C:\EDITOR\EDITOR.PRG@ *.C@
#G 03 04 C:\EDITOR\EDITOR.PRG@ *.DOC@
#G 03 04 C:\EDITOR\EDITOR.PRG@ *.TXT@

Therefore, whenever you doubleclick on a .S, .C, .DOC, or .TXT file,
the program EDITOR will load and hopefully load the document as well, if
the program is written to accomodate that feature.

Hmmm, you just wanted to know if it's good practice to use multiple
file extensions. I guess so. :^)

e Also, can you Install a new application for an extension that is
>already used for a different application to "deinstall" the old one ?

Not sure. Depending on how DESKTOP.INF is read, the old application
may be ignored or the new one may be ignored. In both cases, however,
the application and its extension will still be left in DESKTOP.INF as
I don't think the desktop deletes unused applications. You will have
two programs looking for .S for example. I still recommend editing
the DESKTOP.INF if you want to change anything. It's a little more
hassle, but it insures that everything will work the way you want it to.

> And finally is there any limit to the number of applications you
>can have installed ?

I think there is, but I don't know the number.

3756. Spectre & Panasonic 9 pin owners rejoice!

Newsgroup: comp.sys.atari.st
Date: 1991-05-07 03:16:50 UTC
From: bayers@hub.cs.jmu.edu
Message-ID: <1991May7.031650.19710@hub.cs.jmu.edu>
Source record: 232310

After years of searching, I've finally found a printer driver
for Panasonic 9 pin printers that seems to work under the Spectre
Macintosh emulator! It is available for anonymous ftp from
mac.archive.umich.edu (not the same machine as a.a.u.e), or if
you'd raher 141.211.168.70 under:
/mac/utilities/print/panasonicdriver.sit.hqx
I haven't put it through extensive testing, but I was able to
print a GIF image in WordPerfect 2.0 in low and high quality modes.
It's just a chooser file, so throw it in your system folder, select
it under the chooser, and away you go! It's even freeware, so make
copies of it for all of your friends! Seems to me that this would
make a great freebie for the next spectre PD disk, so if anyone
knows Dave Small personally, you might want to point this out to
him (he's never responded to the email messages that I've sent).

What I would like to know is simply how you got it? I tried to get
Overscan 3 from atari.archives.umich.edu several times, but I never get a
response. In fact, that happens alot. Here is the string I sent, just
in case the problem is with me:

sendb utilities/overscn3.arc aa,ab,ac,ad

I seem to get no response whenever I request it. I also got no response
when I requested sendb game/gnuchess.arc aa,ab,ac,ad and sendb
cli/okami12.lzh aa,ab,ac,ad for some reason. Have the files been moved,
or am I doing something wrong? I have the "Help" file and the "Master
Index" file. I also wasn't able to request "Index" from any directories.

I hope someone can help me with this problem, as I am stumped.

3760. A correct midi interrupt routine.

Newsgroup: comp.sys.atari.st
Date: 1991-05-07 07:28:22 UTC
From: geert@ahds.UUCP
Message-ID: <1985@ahds.UUCP>
Source record: 232319
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi midi gurus,

A few weeks ago someone asks for a correct midi interrupt
routine that does get rid of the mouse interfering with midi.
I wonder if someone has written such a routine.

Here's my probem:

When changing the midi vector of the standard tos calls
to your one (I don't ment midiws or Cconin) in
the particular structure (don't know the name of it because I am
writing this all of my head), does seem to work fine.

However, when bulking some midi data to the ST I (and not
only I) found out that some data will be lost. I think
that this comes because the mouse and keyboard vectors
are on the same intterupt level (to much unfortunately)

Has anyone found out how to pass this problem?

Geert

>
>-Andy-

Hello Andy,

if an DA hooks into system vectors and does not follow the XBRA rules,
Chameleon can't unload it. Make a folder with 'well-behaved' DAs and
another folder with the 'bad-guys'.

A lot of people load the DMC-laserbrain with Chameleon even knowing that
they can't unload it (because it does not following the XBRA-rules...).
Loading the printer-driver at boot time costs a lot of memory. If you load
it with Chameleon, you only loose this memory if you really want to print
something... They install 2 or 3 Chameleon's, one only for the laserbain,
the other two for loading/unloading DAs.

If Chameleon is propperly installed under GEMINI, you just have to double-click
onto a DA-file or icon to load it via Chameleon.

Hardly. They just did a panic fix to make it work with the TT and maybe fixed a few horror bugs while they were at it. Timeworks is static. The PC version isn't though and they are pushing the followup Desk Press.

At last! I apologise for the delay, but the copy of the files I was sent got deleted by accident and I've only just managed to get my backup back onto the system. Having said that the archive is just over 200K long, so it is a biggy. Anybody with ftp access can find it at atari.archive, directory: /atari/programming. The files are progem.arc and prosrc.arc.

Anybody without ftp access mail me, and I'll mail the uuencoded ZOO file to you.

The Sorcerer is 'Only visiting this planet' but can be found at:

>the highest, and it doesn't matter if some are skipped. The TT reads from 0

Wrong. The limititation is not in the BIOS, but in AHDI. The BIOS boots
from the first drive with an executable root sector (the TT takes the
SCSI drives first). But AHDI only looks for devices starting at #0 in
sequential order.

>up in SEQUENTIAL order. If you skip a number the others are invisible. If

3767. Spectre GCR - Transverter loses data.

Newsgroup: comp.sys.atari.st
Date: 1991-05-07 11:24:46 UTC
From: johnr@cged.co.uk
Message-ID: <1991May7.112446.11373@cged.co.uk>
Source record: 232332

I am running Spectre GCR 2.65. I have a hard disc with four ST partitions and two Mac HFS partitions. When I use the Transverter program to move a file from an ST partition to a Mac floppy (MFS format), a part of the file gets lost.

The files I am moving are PostScript files of about 100K in size. Typically, I lose a few hundred bytes in one lump, somewhere in the middle of the file. I get no warnings or messages; the first I notice is that the printer doesn't understand the PostScript. It seems to happen nearly every time. I've had to switch to a different method of getting my files to the printer. Can anyone suggest what is going wrong?

Some more info: my floppy drive seems to behave itself most of the time. Occasionally, I get a Mac floppy corrupted and when I try to read it on a real Mac, it complains the disc is unreadable. Might be linked, might not. I sent off for Spectre 3.0 a few weeks ago. Might this help when I get it?

Perhaps is should be mentioned that the AHDI 3 partition scheme is well documented and that it's a problem of the other hard disk manufactures if they are not compatible. There *ARE* third-party drivers that are AHDI-3 compatible AND know about the TT's SCSI port (in fact, I am one of the authors of one of them).

Well from what I have just read in Znet or was it ST-Report, that
WordPerfect has droped Atari all together...
There was some thing about the Germans did not want a USA product
bundled with Atari computers,(about 10,000 units),
they wanted a German product instead..
WordPerfect did not like this, and decided that they could no longer
afford to support the Atari Version..

Correct me if I'am wrong, but this is the way I read it..

>
> Question: Does anyone think this goes against USENET ethics about
>commercial advertsing, etc.?
> Question: Would anyone be interseted?

This sounds like a very good idea to me. An on-line mail
order service would be a very convenient source of info on price/
availability of software etc. for all netters. If Mark can provide a
good range of stuff at decent prices, and make a few bucks in the
bargain, I think we'd all win big.
The rub is that regular posting of a mail order catalog
would violate news guidelines for commercial postings, which allow
for only 1 short announcement of a product or service. I can't see
any objection, though, to maintaining a mailing list for the catalog,
or else setting up a simple mail server that would allow people to
explicitly request it. (If you decide to go the mailing list route,
Mark, please add my name to the list. :-) Perhaps a line or two could
be added to the FAQ document informing new users of the service.
This, plus a little "word of CRT" advertising in c.s.a.st ("Hey, I
just got the latest version of Blibbleglitz from Mark Choi for $4;
great game!") should keep you in business.

Just a small defense of GDOS...

It was said that G+Plus is better than GDOS because it doesn't load all the fonts at bootup like GDOS does. Well, GDOS doesn't load all the fonts at boot-up.

From what I've heard, G+Plus is much better than GDOS. However, the loading of the fonts isn't included in that reason...

There is another copy of the Progem series under
'gnustuff/tos/progem.LZH'. This copy needs 'proff' to be printed out,
but it contains 17 sections (the one in the 'programming' directory
only has the first 13), the programming samples in appedices and an
index.

Hello,

I FTP a lot and have found a site in Australia which contains sound files of some sort. But the extender is .au which I assume means Australian University since that is the site. This is not an ST site, they have many GIFS and sound files though. Has anyone tried to use these files on the ST. I ask because most are very (600 - 800K) songs and I would rather ask than try and fail (2400 baud is slow). Anyone with any info, please Email.

Thanks,

Stephan

Hi there,
are you currently planning to support UNARJ, UNZIP or the soon coming STZip??
It seems that we ST-users are climbing up the ladder of aviable archivers,
all we need is some good gui to make life easier...
/s/ Udo

Hi... I'm debating selling my 1040ST and was curious what I could get
for it... so I'm taking offers for the following:

Preferably as a system but will seperate if necessary..

1040ST 2.5 megs tos 1.4, with clock chip
sm1224 Color Monitor(One of the original color monitors..)
sm124 monochrome monitor, panasonic kxp1091 printer, atari SH204 20 meg hard
drive. Best mouse,1200 baud modem,
Timeworks Destop Publisher, WordUp, Spectre 128

There are several Spectrum512 --> GIF and GIF --> Spectrum512 coverters, but does any one have programs that handles 4096 (on STE). I digitize pictures to Spectrum with 4096 colors on my STE but the SPC2GIF converter doesn't understand the extra STE color-bit and messes everything ut (of course I can save them with just 512 colors, but then the result is so much worse and the GIF picture gets worse to...) i would also like a GIF to Spectrum converter that use all 4096 colors on the STE (SPCSLIDE that comes with Spectrum does handle STE palett - Why no other programs....)

3789. Is there an ESDI adapter for the Atari?

Newsgroup: comp.sys.atari.st
Date: 1991-05-07 21:14:31 UTC
From: figuei@arakis.rutgers.edu
Message-ID: <May.7.17.14.30.1991.174@arakis.rutgers.edu>
Source record: 232406

Hello! I could have the chance to get (for free or very cheap) an ESDI disk drive, and was wondering whether such a beast can be connected to an Atari ST (I have an ST1040). I know that there are SCSI adapters for the ST, but are there any ESDI adapters? I am quite hardware-ignorant, and have never programmed a disk drive but would be willing to do it if I can get a cheap, huge disk! Thanks in advance.

3790. The 16/32-bit Computer Support Team

Newsgroup: comp.sys.atari.st
Date: 1991-05-07 21:53:13 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <9105072153.AA05743@cwns10.INS.CWRU.Edu>
Source record: 232344

INTRODUCING...

16/32-bit Computer Support Team

The 16/32-bit Computer Support Team is a group of individuals on the Cleveland Free-Net Atari SIG dedicated to bring in the most important information for your Atari ST,STe,Mega,Mega/STe,STacy, and TT computer around!

This is no joke. The 16/32-bit Computer Support Team is extremely serious in what it is trying to do and is doing it for everyone, including themselves.

The 16/32-bit Support Team's main goal is to create an information source for all Atari users.

Have you ever NEEDED reviews for certain software and hardware but didn't know where to find them?

Do you want a bulletin board that has only the MOST valuable information coming from Usenet, CompuServe, and GEnie?

How about ONLY the most valuable information taken from online magazines (with credit of course) posted to the bulletin board so you can keep up with everything without READING everything?

What about a summary section that gives you more information on a product than just the name?

And how about a Tips & Tricks section that tells you all kinds of
things that you can do with your computer that you never knew?

And lastly- would you like to see a Support Team for Atari Computers that
is so powerful that even Atari Corporation will listen to what they
have to say?

A 16/32-bit Computer Support Team is forming with goals that its members
are determined to reach. The Support Team already has a system that will
hold all of this information and it is accessible through Internet. There
is already a "16/32-bit Info & Support" area established on this system for
the Support Team.

There is no enthusiasm for computers like Atari computers.
The users are a VERY unique breed and that is why an unheard of Support Team
like this can be formed.

So, how can the Atari 16/32-bit Computer Support Team help you get the
most out of your computer?

The Support Team works by a system called synergy. Each team member
does a part to contribute to the success of the goals set by the team.
Each person in the team knows that he or she could not get A LOT of reviews
or summaries by themselves to meet their needs. If a team member has
only collected two reviews on MIDI software and there are four other
software titles that he has not read about that could satisfy his needs,
he would be missing out- especially if someone else has those reviews.
If both these people get together and post the reviews in a certain area,
they can get the most out of it by sharing information that each other
had. The more people, the more reviews that can be shared.

This is what the Atari 16/32-bit Computer Support Team is all about.
It makes sense!

If a team member goes to the Atari SIG on GEnie and another member goes
to the Atari SIG on Compuserve, they can post messages in the Cleveland
Free-Net Atari 16/32-bit Computer Support Area to trade information that
the other has not received. A person who does not call Compuserve or GEnie
but writes reviews for products can trade his reviews for their Compuserve
and GEnie information. Everyone benefits by joining the 16/32-bit
Computer Support Team.

Not a bad idea, aye? But if it is such a good idea, why hasn't it been
done before? It hasn't been done before because there was no
organization before. Now there is! And it can work like a powerful tool
for each and every one of us.

What can you do to be a part of this "Atari 16/32-bit Support Team"?
You can become a team member! As a team member, you will be contributing
a little and gaining a vast amount of information.

Can you imagine if you joined the Support Team, contributed 4 reviews
and there were nineteen other team members who did the same? There would
be 80 reviews for you to search through anything you need anytime you may need

it. This goes for EVERY SINGLE ASPECT that the Support Team has to offer-
not just reviews. Now let's take even a higher number. What if there were
fifty people that contributed 4 reviews to the Support review section?
That is 200 reviews that can be obtained by you and you only had to
give 4 reviews. The number can grow tremendously by more people joining
the Support Team without you having to do any more work.

This message is originating from the Atari SIG account on the Cleveland
Free-Net Community Computer System.

If you would like to make the most out of your Atari Computer and start
something that other computer owners could only dream about, reply to this
message and find out what you can do as a team member to reach the goals set.

Get the most, why stay with less?

Thanks,

Atari 16/32-bit Computer
Support Team

** Followups to news.groups **

In article <1991May7.192731.5241@zorch.SF-Bay.ORG> xanthian@zorch.SF-Bay.ORG (Kent Paul Dolan) writes:
> [assorted praises of comp.sys.amiga.advocacy in getting a lot of]
> [junk out of the other comp.sys.amiga.* groups]

Absolutely. Of the various new groups created in the comp.sys.amiga re-organization, this one was one of the most useful.

Before this newsgroup was created, there were a whole lot of posts from people saying why the Amiga was so much worse/better than some other computer. Well, it bothered me. For better or worse, I have an Amiga, and I can't toss it aside and buy another computer. I want posts that will tell me how to make it more useful, instead of telling me how dumb/stupid I was to spend all that money on one. All of those comparison posts were simply not useful to me or any of the people who already own a computer (which includes most of the readers of comp.sys.*).

After the .advocacy group was created, a lot of this moved out of the groups in which I am interested. I think there was only one persistent thread, which compared the Mac to the Amiga. This eventually went away. It was nice seeing all of the followups to .advocacy at the end of the thread. Right now, there are *none* of these threads in the groups I read. It is indeed a pleasure. In fact, if one of these threads does crop up in one of the groups I read, it's reassuring to know that I (and lots of other netters) can tell the errant posters to simply "...take it to .advocacy."

On the other hand, those people who do like to read and write about these things now have an opportunity to do so. I usually see well over 200 unexpired posts in that group. People who want to talk about those sorts of things have an audience there. Mind you, I imagine that they have an audience that is rather likely to jump all over you if you post something, but....

The .amiga.advocacy group has been such a success, I would strongly suggest that the other personal computer areas that have a problem with certain posters comparing their machines with other ones create their own .advocacy groups. The areas where I think there are likely to be problems (I don't read, sorry) are comp.sys.next, comp.sys.mac, and comp.sys.atari.st. (Is a NeXT a personal computer or a workstation, anyway? It's marketed like a personal computer but it acts

like a workstation....).

Of course, you folks can keep struggling with your kill files if you want....

>there's no Atari monitor which does this, are there any multi-sync
>alternatives?
>

Atari's TTM194 is the 1280x960 monitor. There are quite a few other
vendors which use the exact same monitor, including case design. I saw
a picture of a Sparc station, I think it was, with an 'Atari TTM194.'

Atari also sells a multisync for the TT to handle all the other resolutions
(5 of them, 3 ST and 2 TT). It's called the PTC-something-or-other.

Several Atari developers, including Gadgets by Small and DoubleClick, use
Panasonic C1381s with their TTs.

3797. 3 bombs

Newsgroup: comp.sys.atari.st
Date: 1991-05-07 23:13:18 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991May7.231318.12305@lsuc.on.ca>
Source record: 232404

I've been working on a program for a few months now and it's got one "last" problem that I can't fix. I've been staring at it off and on for months now. The program is graphics oriented using GEM calls. As far as I know I've done everything I need to do for a "clean exit" back to the desktop. But I still get 3 bombs when it returns to the desktop. Functionally the program is usable as-is. But I don't like the idea of marketting a product that bombs on exit. I've compiled the program with Sozobon C and I was wonder if this is a specific problem with Sozobon. Or is there something I don't know about exiting from GEM?

Command lines can be up to 125 characters long.

If you need to pass more information than that, there are three currently
used methods, of which one, XARG, is currently endorsed by Atari Corp. The
file EXARG.DOC in the Gemini distribution (see comp.binaries.atari.st)
will tell you all you need to know. There's some code in the samples
folder to show how it's done.

The Sozobon C compiler and dlibs support another method called ARGV.
See the dlibs sources.

Mark Williams Co. uses a third method with its C compiler, which, as has
been mentioned, is no longer being updated.

Whooops. The problem mouse was not a Golden Image, it was made by Naksha
(which is a british company, despite the name). Sorry about that . . .

And it did once I got rid of G+PLUS.* .....

> >2. That Tree* program LOOKS great but blows up my computer EVERY time
> > I attempt to use it. With or without Gemini. I don't recall seeing
> > anything in its docs about required TOS versions....
> Again: please describe the problem exactly!
See below... (I don't have the time (this week) to go into more detail)

> >3. How do I add icons to Gemini ?? I've done it using a resource
Had to resort the icons a couple times before they (the big & small ones) lined up. Also had to go back and redefine what each one stood for. Guess the rules for assigning icons is based on their order in their trees and if you sort them that changes so....

Scenario --> According to sysinfo.prg [System Information version 2.72 dated Dec. 22, 1990] My computer has the following -->
TOS 1.0 (but I already mentioned that....)
GEMDOS 0.19
GEM 1.2
and the country code is USA.
(also, sysinfo (and mupfel) can't figure what driver software my hard drive uses {It's something from Supra})

For AUTO folder programs I have :
DESKMGR2.PRG (version # unknown)
QUIKSTM.PRG (the version that came in STart one month)
FOLDR100.PRG (does it have a version number ??)
Desk ACC's :
Rho Control Panel 1.2e
Chameleon

If I try and run TREEVIEW.{PRG,ACC} version 1.2i my ST crashes.
doesn't matter if G+PLUS is there or not. The only difference w/G+PLUS

installed is how it crashes. Without G+PLUS clicking on the scroll bar crashes it with 2 bombs, but the scroll bar works fine with G+PLUS. That button with the "F" in it causes crashes also. The kind depends upon which button on the dialog button you click. Clicking Metafile without G+PLUS drops you back to mupfel. With G+PLUS, it wipes out the top (menubar) part of the screen..... One of the other buttons in that dialog box gives you 4 bombs.

Now... running venus.app from mupfel.mup.
This works fine once I got rid of G+PLUS. But that's too much of a price to pay right now....
If I leave G+PLUS installed -->
None of the things in venus.inf are loaded and it blows up if I do anything. That's with Polyline mode in G+PLUS set to solid. If that is set to normal mupfel TRIES to load venus.app but just sits there spinning my hard drive and the only way out is to reset.

Miscellaneous:
The version of G+PLUS that I use is 1.3 from March 19,1989.
that vdi_fix.prg that came with gemini didn't work with my ST.
Something about an unsupported OS version.

Sorry this took so long to describe.

Now back to your regularly scheduled program(ming)....

I think I heard that version 5 of ICD's software works on the TT. Can anyone
confirm of deny this claim?

The first thing I did for my DJ+ was to write a driver for 1st Word.
It does most things (bold, underline, super/subscript (a bit)).
I've been meaning to update it at some stage.

Someone mentioned DJ margins. They took a bit of working out. I use
Calamus which allows proper margin use. If you set the margins on the
screen to look OK they will come out off center etc. on the printout.
Just make a large box (not filled in of course, just the outline)
taking the whole page, print it in draft, adjust
it print it in draft again, adjust it (all on the same bit of paper)
until it comes out centered and no bits missing and then set the
margins to the perimiter lines of the box. Off the top of my head,
left = 2.5 cm, right = 0.5 cm, top = 3 (approx), bottom = 0.5 cm.
This will allow some space on the left for hole-punching.

Very interesting idea... sort of an "on-line" Atari user group...

Just a couple of comments/questions...

> Do you want a bulletin board that has only the MOST valuable informatio
>coming from Usenet, CompuServe, and GEnie?

Not a flame, just a caution... be careful about extracting information from commercial online services... while they don't like to make an issue of it, they DO claim a compilation copyright on the contents of the service. If you read the fine-print in the membership application, you'll see that they generally prohibit the reposting of information without express permission, generally on a case-by-case basis. The recent flap in the GEnie ST Roundtable over extracting portions of messages is a case in point.

They're in business to make money from the information on their service, and they'd naturally rather have the people come to them and pay for it.

>A person who does not call Compuserve or GEnie
>but writes reviews for products can trade his reviews for their Compuserve
>and GEnie information. Everyone benefits by joining the 16/32-bit
>Computer Support Team.

A question... would you be willing to let your reviews be re-posted to GEnie or CompuServe..?

I had exactly this problem with a GEM application I wrote several years
ago. In my case, it turned out that one of my menus was too large. I
think it was 15 lines by 30 characters, which was evidently too big for
GEM to handle. Making the menu one character shorter fixed it.
(Technically speaking, the "rule" is that menus can't be bigger than
1/4th of the screen. My menu didn't look that big on the screen.)

Thanks for the information. I'll get the latest version of Gemini from atari.archives.umich.edu and see what happens. I am programming in Pascal, but C is close enough to convert back and forth. In the documentation I have, which doesn't seem to be too correct to begin with since the Pexec function they supply doesn't work at all, forces an 80 character limit on you. I'll see what the EXARG.DOC file says. Do I have to use Gemini to use the method of parameter passing? I use NeoDesk right now, and I'd like to keep using it. The last version of Gemini I saw was 1.1. Anyway, I'll take a look. Thanks.

I use a program on atari.archive called 1stw2ps.arc (in the printing dir).
It converts a 1st Word DOC into a postscript file which I save on a MSDOS
formatted 3.5 and print at Uni. Works fine.

James.

3811. gcc, MiNT and Minix partitions

Newsgroup: comp.sys.atari.st
Date: 1991-05-08 10:29:21 UTC
From: dpg@cs.nott.ac.uk
Message-ID: <1991May8.102921.6575@cs.nott.ac.uk>
Source record: 232415

About a week ago, I upgraded my version of MiNT from 0.7.1 to 0.8, and was delighted to find 'minit' in the utility distribution. I duly backed up my HD, re-partitioned it with a small (8 meg) Minix partition, and restored everything (putting MGR on the Minix partition). Then I came to move my working directory onto the Minix partition, and, horror! I discovered that GCC parses all the filenames into UPPERCASE. Is there anything I can do about this, short of getting all the source for gcc 1.39 and fixing it myself?

I had hoped to get on with installing TeX, but I'd really like to fix this first.

Can anyone out there help me?

All that's necessary is that the parent process and the child process agree
on whatever extended argument-passing convention is in use.

If you're programming in Pascal, I suppose it should be easy enough to
code the parent's side of things, assuming the compiler allows you to have
access to the GEMdos calls. But the child's ability to parse the command
line may be another matter entirely. Can you modify the startup code? Or
is it hardwired into the compiler? This may be a good time to switch to a
less restrictive language. :-)

While we're on the subject:

Has anybody tried writing a replacement for Sozobon's dstart.o module that
supports XARG? And is it possible to support both XARG and ARGV?

Well I don't know what you mean by a CGA cpmpatable. Multisyncs should handle
about everthing. They have an Analog input which is what you want and a TTL
input for CGA/EGA.Don't confuse multiscan monitors with multisync. The Sony
13xx series work as should most ohters.

3814. Latest Picture Formats List

Newsgroup: comp.sys.atari.st
Date: 1991-05-08 14:18:29 UTC
From: dmb@wam.umd.edu

PackBits Compression Algorithm

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special

information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]
1 word image height [unused, always 200]
33 words reserved for future expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
----
22 bytes total for header

? words image data (words of screen memory) for each frame, in
order

```
<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed
separately; i.e., all data for a given scan line appears before any data
for the next scan line. The scan lines are specified from top to bottom
```

(i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane. Note this is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed in this buffer.

o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that do not follow the standard format, so let's be careful out there. What is described here is the format that David Mumper's original TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits hold left (start) limit; low 4 bits hold right (end) limit
1 byte direction and speed of color animation (negative value indicates left, positive indicates right, absolute value is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)

}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

Note that the Spectrum 512 mode's three palette changes per scan
line allow more colors on the screen than normally possible, but a
tremendous amount of CPU time is required to maintain the image.

The Spectrum format specifies a palette of 48 colors for each scan line.
To decode a Spectrum picture, one must be know which of these 48 colors
are in effect for a given horizontal pixel position.

Given an x-coordinate (from 0 to 319) and a color index (from 0 to 15),
the following C function will return the proper index into the Spectrum
palette (from 0 to 47):

```
/*
* Given an x-coordinate and a color index, returns the corresponding
* Spectrum palette index.
*
* by Steve Belczyk; placed in the public domain December, 1990.
*/
int
FindIndex(x, c)
int x, c;
{
int x1;

x1 = 10 * c;

if (1 & c) /* If c is odd */
x1 = x1 - 5;
else /* If c is even */
x1 = x1 + 1;

if (x >= x1 && x < x1 + 160)
c = c + 16;
else if (x >= x1 + 160)
c = c + 32;

return c;
}
```

<Spectrum 512 (Compressed)> *.SPC

```
1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map
--------------
<= 50014 bytes total
```

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by

one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included). If a palette
entry is not included, it is assumed to be zero (black). The least
significant bit of the bit vector refers to palette entry zero, while the
most significant bit refers to palette entry 15. Bit 15 must be zero,
since Spectrum 512 does not use palette entry 15. Bit 0 should also be
zero, since Spectrum 512 always makes the background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation

32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)

32000 bytes total

<Animatic Film> *.FLM (low resolution only)

```
1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major)
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines
-------
? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored
separately starting with plane 0. There is, however, no standard way of
storing the color palette. Some programs may save the palette in separate
files, some may extend the header. For this reason, you should never
assume the header is 8 words long, always get the header length from the
2nd word of the header. Also, the line width in the 7th word is the number
of pixels in a line. Since the data is encoded in byte-wide packets, the
actual unpacked line width is always a multiple of 8, and may be 1-7 pixels
longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern
length" word in the header. Repeat this
pattern n times.
```

If n = 0 then:
Scanline run. Data for the next scanline
is to be used multiple times. Read the
following record:

1 byte flag byte [$FF]
1 byte number of times to use
next scanline data

The data for the next scanline follows,
compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte
determines the number of bytes to use
literally. The literal data bytes follow.

otherwise Solid run. The value of x determines
what to draw. The high bit specifies whether
the pixels are set or cleared. A 1 indicates
a byte-run using $FF, a 0 indicates a byte-run
using $00. The low 7 bits, taken as an unsigned
quantity, specify the length of the run in bytes.

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved

```
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
-------
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).
```

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)

4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
1 word = image height in lines
1 word = image x-offset [usually 0]
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)
1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

```
4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may
not be in this order. You should always look for the ID bytes to find a
certain chunk. All chunk IDs are followed by a long value that tells the
size of the chunk. This is the number of bytes that FOLLOW the 4 ID bytes
and size longword. The exception to this is the FORM chunk. The size
longword that follows the FORM ID is the size of the remainder of the file.
The FORM chunk must always be the first chunk in an IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data

An expanded picture is simply a bitmap. The packing method is PackBits
(see below), and is identical to MacPaint and DEGAS Elite compressed.

The (decompressed) body data appears in the following order:

line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]

The FORM chunk identifies the type of data:

"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)

<MacPaint> *.MAC

1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row,
and the bytes map the pattern rows top to bottom. The
patterns are stored in the order they appear at the bottom
of the MacPaint screen top to bottom, left to right.
204 bytes unused
-------------
512 bytes total for header

< 51200 bytes compressed bitmap data
-------------
< 51712 bytes total
```

NOTE: The version number is actually a flag to MacPaint to indicate if
the brush/fill patterns are present in the file. If the version is 0,
the default patterns are used. Therefore you can simply save a MacPaint
file by writing a blank header (512 $00 bytes), followed by the packed
image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The packing method is PackBits (see below). There are 72 bytes per
scan line. Each bit represents one pixel; 0 = white, 1 = black.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by
Electronic Arts/Commodore for use in the IFF standard, and then by Tom
Hudson for use in DEGAS Elite. The algorithm is currently used in
MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line
is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

3815. MEGA STe VS. STe

Newsgroup: comp.sys.atari.st
Date: 1991-05-08 15:17:23 UTC
From: schultzd@kira.uucp
Message-ID: <1991May8.151723.29099@msuinfo.cl.msu.edu>
Source record: 232425

This summer, I hope to have enough money to upgrade from my lowly 520ST (which has saved my butt quite a few times in the last year) to a new STe. My question... I need prices / specs on the STe (4meg) vs MEGA STe (4meg)). Of course, since they use SIMMS for memory, the 4meg isn'y near as important. The MEGA is 16MHz while the STe is only 8, right?

Basically need PRICE along with any thing else relevant.

THIS was already hashed out earlier in the year, so stick to e-mail replies...

Later...

Actually, I own MWC and have pretty much settled on it. It really depends on your use for the compiler. MWC seems to be the best Unix-compatible compiler available for the ST (this side of GCC, but I humbly put forth that only crazy people use it without 4M, and I don't have 4M). If I were developing software for GEM on the Atari, I'd probably choose something different like Prospero, Laser or Turbo C.

3817. ST zoo for Unix

Newsgroup: comp.sys.atari.st
Date: 1991-05-08 15:43:50 UTC
From: agostino@concour.cs.concordia.ca
Message-ID: <261@daily-planet.concordia.ca>
Source record: 232426

Hello,

Does anyone know of a "zoo" for the ST which will run on Unix (Sun3
running SunOS 4.1). I have this 500k ST zoo file on a Sun which I need to d/l
to my ST. However, it would be better if I could unzoo the file on the
Sun and d/l the smaller constituents separately.

Thank-you for any help you can give.

Agostino

Uh-oh. I am trying to pass long command lines to RZ.TTP (The Zmodem File Transfer Program) for batch Uploading and Downloading. The problem with the limit becomes obvious when you realize how few pathnames can be put on an 80 (or even 125) character command line. I wrote a program that will capture the command line when it is run and display it, and will try it on other programs that use SZ. I don't think that it supports the XARG convention you mentioned. Any other ideas?

The monitor should _not_ be CGA compatible - CGA is digital, the ST needs
analog. The Pansonic C1391 should work nicely; the C1381 won't sync low
enough (15.75KHz is needed) for the ST in color. Don't know about the
C-1335. Others known to work include the NEC Multisync 3D (and presumably
4D and 5D, big bucks), the Sony 1302 and 1304; most others should also work
if they sync slowly enough.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
I am sorry....I meant to write "but *not* both in the windows"
Gemini can definitely display both large & small icons on the desktop

>Thanks for the explanation of how to edit icons. GEnie has a couple
>of files of add-on icons. Unfortunately, I don't think you can combine
>*.RSC files with the Mark Williams resource editor, which is the best
>of the three I have. Are others more flexible?

You are welcome Steve. Unfortunately I don't have an account on GEnie
I cannot afford it 8*(

I think there is no resource editor combining *.RSC files...I am also
using Mark Williams' and I've worked with RCP (comes with Laser C), RCS
(from Digital Research), and MKRSC (posted to the net). None of them let
you merge *.RSC files.

But why should someone combine 2 *.RSC files in 1? I don't see any reason
for doing something like that. (I may be wrong)
Perhaps you misunderstood(?) my explanation of mixing large & small icons
in the _same_ RSC file. I said one can put large & small icons in the same
tree (e.g. FORM2 or FORM3) in the file GEMINIIC.RSC (so, it is just one
resource file). If I remember well, I also said that I don't think it would
be such a good idea. It would result in having both large & small icons in
the same window. I haven't tried it though.

BTW, are there people still using NeoDesk? 8*)

>advantage of the 1200x960 monochrome and the 640x400 color mode? If
>there's no Atari monitor which does this, are there any multi-sync
>alternatives?

Enough of this misinformation.

TT high rez is 1280x960, an industry standard. This resolution requires a monitor along the lines of the Moniterm Viking. (I don't know if that particular model actually works, but you need something like it.) Atari either sells or is planning to sell such a monitor. I don't have any real information on our marketing plans in that direction: I just don't know.

This type of monitor can't show any of the other TT or ST resolutions, and no Atari monitor which can show the other resolutions of the TT can show TT High. In that respect this is like the ST:

ST
REZ X,Y,COLORS MONITOR REQUIRED
ST LOW 320,200,16 ST color monitor
ST MED 640,200,4 ST color monitor
ST HIGH 640,400,bw ST mono monitor

TT
REZ X,Y,COLORS MONITOR REQUIRED
(all ST modes above) TT color monitor
TT LOW 320,480,256 TT color monitor
TT MED 640,480,16 TT color monitor
TT HIGH 1280,960,bw high-rez monitor

I am speaking only for monitors that Atari sells and uses. I guess there are monitors which you can hook up to ST's and see all the ST modes. There may be monitors that can show all six resolutions of the TT. I suspect such a monitor would be hellishly expensive -- moreso than the 1280x960 monitor, which is not cheap.

Another note: ST HIGH on the TT is actually a color mode: you can choose any two colors, not just black and white.

3825. Info about the Windsor Atari Show

Newsgroup: comp.sys.atari.st
Date: 1991-05-08 20:30:39 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <5227.2828199f@miavx1.acs.muohio.edu>
Source record: 232433

This past weekend I attended the Windsor Atari show, so I thought I would let everyone know what happened there. (this is all from memory, so some things might be wrong.)

Stacy's, Mega STe's, and TT's were all around. (I think I saw only three or four 1040 ST's, and they weren't doing much.) Gadgets by Small was there, showing the 33 MHz 68030 upgrade board for ST's. (Even for 1040 ST's, but it does require you to put your computer into a bigger case.) I didn't get to play with it though.

Atari had a booth there, with some ingenius "pop-up" bochures for the Mega STe and the TT.

The seminars were where most of the good stuff came from though!

Bob Brodie for US Atari and Jeff "something" from Canada Atari talked for a little while, and then held a Q&A session. Some of the key points are:

FSM GDOS will cost <$100, but I don't remember a release date. (He (Bob) didn't give a definate date though)

Atari has purchased the source code to Word Up! but Bob couldn't say what for.

All Mega STe's and TT's have the drive controller chip socketed so that a 1.44M drive upgrade would be simple. Their engineers in Israel have reverse engineered the WD1772? chip.

They plan on phasing out the Stacy in favor of the ST notebook, which will be shown at Fall Comdex.

The 8-bit computers are being phased out also. Reasons were that a 130XE with disk drive comes real close to the price of a 520STFM.

Thats about everything I can remember now, I wish I would've took a tape recorder with me, or at least a notebook!! (I will be prepared for the next one though. (In Chicago in November)

Anyway, this was my first Atari show, and it was kinda neat to be able to places faces with names.

Later.....

[more pleas for help deleted...]

>I once hard of a product called "Turbo-Jet" (??) my NeoCept (??)
>Anone else heard of this.

TurboJet - Available from E. Arthur Brown Co. (800) 322-4405. I don't know
if they have a version for the DeskJet. I think it's LaserJet only.

DeskJet GDOS Drivers in general - Try contacting MiGraph (makers of EasyDraw
and other fine products). Sorry, don't have the number handy. I'm pretty
sure that they sell one.

Hope this helps.

Hi,

Sorry to post this here, but can't email just yet.

Anyway, Jeremy if your still willing to breakup the system I'd like
to buy the SM1224 for 150 + shipping. If that sounds good call me
at the number in my .sig 8:30 to 5:50 EST. Thanks!

...Bill

On switching from color->mono w/Timeworks DTP.....

If all you want to do is run DTP in mono from now on, then the easiest thing to do is reinstall the product from the master disks. Be sure to save off anything you want first! Also, you must reinstall while using the mono monitor. DTP doesn't ask you the monitor type, it just figures out what you're using and installs the screen fonts accordingly. If you do this, you'll be able to run in mono, but not in color.

If you want to be able to switch between mono<->color (why?????) The first thing that I suggest you do is get G+plus from CodeHead Software. This little gem will allow you to set up a different assign.sys file for each GDOS application that you want to run, and these files can reside anywhere. It also allows you to select the assign.sys file on-the-fly when an application is started. More importantly, G+plus has special support for DTP that automates the switching of the publish.wid file based on the assign.sys file selected.

Hope this helps.

3829. Chq Inc. and other post-AtariFest questions

1) Does anyone know the status of the Clip-Art and Icon disks
that were being sold by Chq Inc. at the show?
Are they PD, shareware, or commercial?
There wasn't any readme file on any of the disks I got.

2) Is anyone associated with AIM?
I picked up the complete animation set plus the show disk and
all the ST ones work fine except for WERWELTV.SEQ which gets
a "File Format Error".

3) Is anyone associated with MAGIC?
I picked up the clip-art disks 143 and 148 and I am unable to
copy the last parts of both disks without getting
"Data on the disk in drive A: may be damaged."

Source record: 232420

It's up to you whether to make use of the TOS Fopen() or not when you implement your own open() in your own C library. For ordinary files, the value returned will be similar to what other OS (i.e. unix) expects, but when it comes to raw devices (/dev/tty,/dev/lpt,/dev/fd0 etc), you need to be a bit inventive. What I have done is this:
(1) for keyboard/monitor, parallel port, and RS232C port, the returned value by Fopen will be respected but not used. Instead values 128, 129,130 will be given. (The returned value of fffe etc will be kept internally).
(2) for other devices e.g. disk drives and midi ports, the same trick will be applied. drive A will be assigned 256, drive B 257 etc. However, as drives are block devices, read/write and lseek can be done only in units of 512. And we must keep a file pointer for each device. There is no way of knowing the basic features of the device as read/write is normally done to disks that are physically formatted but may lack boot sector info. I simply followed the nomenclature of minix.

At any event, I needed a file descriptor table internally that keeps info to be given to stat() and fstat(). That table also keeps the name of the file descriptor (I sometimes needed to know the name of the file from the file descriptor). Read/write of raw device is necessary in such cases as reformatter(re-initialises the boot sector,FATs and directory) and TAR.

Another thing I needed to use my brain a bit is giving i-node numbers(real id number of files). I think I better keep this secret to myself so as not to bore you to death.

This problem is fixed in the lib. I belive it was first
fixed at Patchlevel 63, but the fix is certainly there at the current
Patchlevel 65.
to determine if you have a fixed version, look in fcntl.h and it
should contain the following lines at around line 81:

```
#ifdef __MSHORT__
#define __SMALLEST_VALID_HANDLE (-3)
#else
#define __SMALLEST_VALID_HANDLE (0)
#endif

#define __OPEN_INDEX(x) (((short)(x)) + 3)
```

It's still that brain-damaged 4.1, isn't it? WordPerfect 5.0 was a
quantum leap forward for them. As far as I'm concerned, anything prior
to that is not fully usable.

>This may be a good time to switch to a less restrictive language. :-)

On this subject, I have an xARG/ARGV/TOS Arguments module for Modula-2, maybe we should put these implementations together at the archive to help promote the use of these less restrictive argument passing techniques.

Oh, and what would be the best order to try accessing arguments? I try xARG, then ARGV, the finally revert to TOS if all else fails. Ideas?

>And is it possible to support both XARG and ARGV?

Yes, depending on how restrictive your language is :-).
Warwick.

Frankly, I can't think of a language that COULDN'T do all this - but then, this isn't alt.religion.computers, so I doubt I'll be told!

Why not put in ICD's AdSpeed in your STE, this will give it the 16mhz cpu. speed.
From what I know in the Mega STE, its only the cpu that has the option to run at 16mhz, is this not Ataries version of AdSpeed, this would be a far cheaper alternative, about $340 from what I can remember.

Mind you I stand to be corrected on this, if my interpretation is incorrect.

I thought that the German GSZRZ18 supported XARG or ARCV.

I am having the same problem with the Shells that support Zmodem, in
the number of files that can be uploaded.

The other problem that I have is SZ.TTP from ZMDM16, for some reason it
drops down to Ymodem, is this caused by the delay in starting SZ.TTP ?.
Is there a way around this ?

A friend here that was using a Philips CM1873, (JVC Japan) from memory,
this was a early Mutisync, CGA/PGA, looks like the early Amiga monitors,
and was only used in the colour modes..
Well this chap brought a STE and found that it would not sync, with a
few changes to sync signals, the Horizontal sync was replaced with the
Composite sync, it now works.
I never found out reason of the difference with the STE.

> XARG convention you mentioned. Any other ideas?

In that case you need to find out what compiler was used to make the RZ/SZ
programs. My guess would be Mark Williams, whose argument-passing scheme
is explained somewhat in the EXARG.DOC file. But that's just a guess.

If it's a correct guess:

Mark Williams passes arguments in the environment, so you need to know how
the environment is handled under GEMdos.

Remember that Pexec takes three arguments: An integer mode flag, a pointer
to a Pascal-style command string (first char of the string encodes its
length), and a pointer to the environment.

The environment is -- and somebody correct me please if I get this wrong
-- a sequence of C-style strings (simple arrays, terminated by a null
byte) with an extra null byte to terminate the environment itself. Each
entry in the environment is of the form

TAG=value

So, if 0 stands for a null byte, the environment might look like this:

PATH=A:\0USER=steve0ICECREAM=Chocolate00

If I read the MWC documentation correctly, it would pass arguments
by adding ARGV= to the environment followed by null-terminated
arguments. Example:

PATH=A:\0USER=steve0ICECREAM=Chocolate0ARGV=sz0file10file20file300

If there's no need for sz to know that the user is steve, the PATH is A:\
and the ice cream is Chocolate, I suppose you can leave that out. :-)

There are other things that can be encoded in the Mark Williams ARGV
string, but this is the basic idea.

In response to Bob's concern over the taking of Compuserve and GEnie information, any information taken from these systems will be taken legally.

Hopefully, there will be a big enough network of team members that all information will be contributed originally by team members and there would be no need for any other information source.

Thanks Bob for making the point (and do everyone a favor- join the team). :)

Even if you DO NOT have access to "telnet", send a reply anyways, I believe Marc Lombardo (leader) will be able to arrange something.

Cross-posted to: comp.binaries.atari.st,comp.sources.atari.st,comp.sys.atari.st,news.groups

I've moved locations at Sun, and my machine came with me. I've moved all my moderation gear over to the new location, so comp.sources.atari.st and comp.binaries.atari.st submissions should be sent here instead of to the old addresses. The new addresses are:

atari-sources@twitterpater.eng.sun.com for comp.sources.atari.st submissions
atari-binaries@twitterpater.eng.sun.com for comp.binaries.atari.st submissions

The panarthea archive server has also been moved to twitterpater. Its address, as you can probably guess, is now

archive-server@twitterpater.eng.sun.com

The panarthea addresses for all of the above will continue to work for a while, but they'll forward everything to twitterpater. If you maintain a list of archive sites, please note the change.

Please let me know if there are any problems. I've tested everything and think I have things completely moved over, but I might have missed something.

I have decided to buy a TT, and need to sell the following STs. I would like
to sell everything in the two systems as listed. I will consider all ofters
on both whole systems and pieces.

System 1

-1040STf w/tos1.4 + 2.5 megs (board can be upgraded to 4 megs <$100)
-SM124 mono monitor
-Quantun Pro80S 84meg 3 1/5 drive in Supra case
-Spectre 128 w/Mac roms - Macintosh Plus emulator
-Star SG10 printer
-IMG Scan image scanner
-LDW Basic compiler
-MicroLawyer
-DC Desktop
-Beckemeyer Hard Disk Toolkit
-Supra hard disk utilities
-Why Wait? floppy & hard disk cache + print spooler + ram disk
-SGS Switch program switcher
-.ACCess CLI
-Micro Kitchen Companion recipes on disk

All software has original docs. I will leave shareware and public domain
on the hard drive. This would be a great system for someone thinking about
buying a Mac. I'm asking $1200 for the complete system.

System 2

-520ST w/1 meg + 1 meg + Z-Time clock chip + Mega keyboard
-CCC Learning Station case with 2 DS floppy drives
-SC1224 color monitor
-Rixon T212A 1200 baud modem
-ST Talk Professional telecommunications software
-Neo Desk
-pc-ditto 3.0 - IBM emulator
-Degas graphic arts system
-UMS Universal Military Simulator
-Dive Bomber
-All Aboard!
-Space Cutter
-Micro League Wrestling
-GATO
-Devon Aire

The CCC case is a metal case that holds two Atari floppy drives plus
power supplies for the computer and drives. Everything, including the

monitor, plugs into an internal power strip with an external power switch. The drives have the cheap mechanisms replaced with Epson mechs. I'm asking $600 for this system.

I also have about 10 Mega keyboards that I would like to sell. These are just the bare bones keyboards. They are a direct replacement for the keyboard in the original 520 without the internal floppy. I'm asking $40 each for the keyboards or 3 for $100.

If you are interested in any of the above, please reply with e-mail or call me at (408) 992-0131. If I'm not home, leave a message and I will get back to you.

thanks,
al

Hi all,
I have recently tried to receive files from both panarthea and terminator
archives, but I only receive a mail message from panarthea with the subject
"Returned mail - User Unknown". I can obtain help and indexes from both
the servers but not archieved files. I have tried specifying a path name,
both ecc_foley@ecc.tased.oz.au and ecc_foley@ecc.uccp , but I still get a
massage about user unknown. Does anybody know why this is happening ?
Many Thanks

I bought my MEGA STe (4 MEG RAM/50 MEG HARD DRIVE) April 2 here in Toronto.
I used to have an old 1040ST (TOS 1.0) and calculated that it would have cost
me the same money to upgrade my memory (pre-SIMMS) and buy a hard drive as it
would buying a brand new MEGA STe. Now I have brand new TOS, double speed
processor and blitter as a bonus.
I would have bought a TT030 but Notator doesn't run on it yet. However, Calamus(amazing DTP
program) is very fast on my MEGA STe compared to the 1040ST so all
is not so bad.
There is another thread which asks the question: Is a high res mouse better than
the stock Atari mouse? Well I gotta tell you that the difference is night and
day. My Golden Image GI-250 mouse takes all the sluggishness out of GEM.
Clicking is way easier and accurate. Obviously I don't mean that GEM itself is
improved; it's just that it SEEMS THAT WAY. I always admired the smooth MAC
desktop-mousing around compared to the Atari. Now it's BETTER than a MAC--the
feel that is. Spend hundreds and hundreds on a computer--why not treat yourselfto an
excellent $75 (Canadian $) mouse?

You're right. But there's so much more to the MegaSTe than just the 16Mhz chip. At least I think so. :^)

I recommend calling Atari at 408-745-2000 and getting a copy of their STe, MegaSTe, and TT brochures. Then again, the brochures don't really give you the feel until your sitting at the keyboard.

But they really are nice brochures.

Has anyone got any info on this upgrade - what exaclty does it do, how
compatible is it, can it be turned of for things that don't run at 16mhz
(ie games), where can I buy one in the UK etc !

Please send any info here or by email to me.

Cheers

Steve - csuab@uk.ac.warwick.cu

I have been fiddling around with Rodney's UUCP modules (Mercury UUCP) and the GUS GEM UUCP Shell for the past month or two, trying to decide whether to keep them or rewrite them.

I has recently been drawn to my attention that said software is generating Usenet Date: headers with the year in full -- that is, 17 Jun 1991 instead of 17 Jun 91.

THE NEW "IMPROVED" C-NEWS WILL SILENTLY DISCARD ALL SUCH ARTICLES, WITHOUT WARNING THE POSTER.

If you use your ST to post to Usenet via UUCP, it is quite likely that Cnews sites around the world have been quietly throwing away all your postings without even trying to tell you. It happened to me.

Yes, Mercury should create date fields in the proper format; but equally, Cnews should not throw away articles which it is perfectly capable of correcting the headers of and of delivering.

If you think that this Cnews behaviour is unacceptable, I would suggest complaining in news.software.b. If we all scream loudly enough, perhaps they will fix it.

I am currently using a Maxtor XT4380E 480 megabyte ESDI drive with my ST. The adapter is an Emulex MD-21 ESDI <--> SCSI adapter card. This baby cooks......
The driver I use the the Supra V2.6 driver selecting the 'other' for controller and disk type. Works fine, however I can only use 190 megs of the disk for TOS. The rest I have written some special code to use as archiving and other stuff.

The Atari uses the same sample data format as the Mac, so if there's
a way to convert Sparcstation samples to Mac format, you can use
them (the data forks) on the Atari as well.

Could some kind Mac wizard point me to a Sparc->Mac sample converter?
Given source for such a utility I could write an ST version and make
many Atari owners happy. (Or at least happier.)

I would think it would be in Atari's best interests to provide an
upgrade path for present ST users of Supra's drives. It shouldn't
be too hard to extend AHDI so that:

1. The driver will work like Supra's driver and find ACSI units
which are not connected in consecutive order.

2. The driver will recognize Supra's extended partitions as well as
Atari's. HDX doesn't have to create them, but it would sure be nice
if AHDI and HDX understood them.

3860. STalker/VAX/Mass-11

Newsgroup: comp.sys.atari.st
Date: 1991-05-09 16:19:42 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <24491@know.pws.bull.com>
Source record: 232255

I am one of the unfortunates in the world who has been forced into using the Mass-11 word processor on the VAX. This is a true WHAT-YOU-SEE-IS-NOT-WHAT-YOU-GET (acronym = C.R.A.P.) word processor. Well, aside from the pain of actually having to use Mass-11, I have been using UNITERM on a 1280*960 Atari TTM195 monitor on a TT. While UNITERM does work, it does not run in a GEM window so all I get to use is the top, left-hand corner of the TTM195.

Yesterday I unwrapped STalker and used it for the first time. Overall, its a good replacement for UNITERM (at least I can use the whole TTM) but not all VT100 features are implemented. I have also run into the following problem.

Mass-11 uses the top four keys on the numeric keypad as PF1..PF4 to initiate and execute commands. For example, PF1 R = replace text. If I start editing a document, all the PFn keys work fine. However, outside a document, at the Mass-11 menu level such a PP (print menu), none of the PF keys work. Why would PF keys function at one level in Mass-11 but not at another?

STalker also does not have KERMIT, which is essential for file transfers at our site. UNITERM has always been THE BEST code I have ever used for KERMITing files (I have used SmartTerm 240, Mac240, RedRyder, Crosstalk, ZSTEM (yech!), VersaTerm Pro). I know that STalker has X/YMODEM, which is popular in the 'BBS' community, however, KERMIT is the fite transfer protocol that I NEED in the scientific community (The KERMIT accessory that I bought with FLASH does not work on the TTM195, just as FLASH does not run). Do any of the PD kermit accessories work on a TT with a TTM195?

> isn't though and they are pushing the followup Desk Press.

GST know that they've made more money out of ST Timeworks DTP in the past than they will in the future, so they're not exactly busting a gut to create new versions of it. It's still probably the quickest DTP program to learn, though, and it's OK if your requirements are simple.

I've not had much time to play with the latest UK version (it replaces v1.12, and is confusingly called 1.h12), but a couple of things I've noticed are:

It seems to need a bit more memory than the previous version. I have about half the memory on my 1040 taken up with ACCs, AUTO progs, etc. (although I can add about 150k to that when I unload NeoDesk) and when I run the latest version of Timeworks it reboots the machine when I try to open a file (of any size at all). If I take out a couple of memory-resident programs - any of them - all is well.

It always leaves behind a temporary file on exit - the old version used to clean up properly (usually).

I haven't had a chance to test whether they fixed the 12pt Dutch font, which used to print question marks (in the Atari laser version at least) upside down.

The current version of 1st Word Plus, from the same stable, does seem to be better than previous incarnations of version 3. The new version 3.20TT allows you to choose a stable or flashing cursor, lets you configure hyphenation via an exceptions dictionary, allows you to redefine the keyboard again (this ability was present in v2, but not in versions 3.1 through 3.14 - it reappeared in 3.15) and allegedly scrolls faster than before (I can't tell - I use Turbo ST so it's all faster anyway.) Oh, and it fixes a printer bug that appeared if you reformatted a doc from single to double spacing, and of course it now runs on the TT.

Graham

Unfortunately, yes. They say they're real busy porting 5.0 to lots of platforms (5 going so far). I think they must be doing something wrong if porting is so expensive. I would be trying to get 5.1 going on all platforms, and would have a "Tiger Team" focusing on portability. They must have machine-specific stuff all tangled up with stuff that ought not to be machine specific.

Now that the Atari-supported graphics situation on the TT has been clarified, does anyone have anything to say about third-party graphics boards for the TT (or perhaps Mega STe)? Anything actually shipping? Anyone at the stage of "prototype working, artwork laid out"? Tell me (us) about the ST/TT world's answer to 8514/a and XGS (did I remember the abbreviations right?).

>FSM GDOS will cost <$100, but I don't remember a release date. (He (Bob)
>didn't give a definate date though)

It will (eventually) be shipped with Mega STE's and TT's, but isn't currently. He didn't know whether current Mega STE and TT owners would get free copies. The cost is due to the fact it uses Ultrascript Type I fonts, which are owned by Imagen and need to be licensed.

>Atari has purchased the source code to Word Up! but Bob couldn't say
>what for.

He suggested to us that Atari would be making it work like "they think it should" (i.e., fix the bugs), but didn't know whether it would be sold, bundled, etc.

>...They plan on phasing out the Stacy in favor of the ST notebook, which
>will be shown at Fall Comdex.

He told us that he expects the Notebook will become the portable of choice, but there are no plans to drop or discontinue the Stacy, and that musicians really don't care about battery use, just ease of transport (for which the Stacy is fine).

>Thats about everything I can remember now, I wish I would've took a tape
>recorder with me, or at least a notebook!! (I will be prepared for the
>next one though. (In Chicago in November)

Other comments...

Efforts are being made (no details on by whom) to allow the Atari CD-ROM to use existing PC-based disks (such as Microsoft Bookshelf)...

MultiGEM is being worked on...

Atari US is going to be much more aggressive at getting the limited production of computers, many of which are now going to Atari Germany...

High-end publishers continue to be amazed by the blazing speed of an ST/TT with an Atari laser printer and Calamus...

He related an amusing anecdote of how they demonstrated Calamus at a Mac User's Group meeting, totally astounding the attendees with Calamus' speed and price, and how upset the Timeworks rep was to hear that Calamus was $199 versus Publish It's $349, and then how they went to an Atari User's Group meeting, and the attendees were outraged about how expensive Calamus was!!

The shells that suppot Zmodem, namely Zflash, have problems with the command line as well. They try to send as many as thirty-two files along the command line, but the command line simply isn't big enough. Not very useful. I received a message from someone that contained a Shar archive, but I haven't been able to extract it since I don't know what a SHAR archive is...:) I'll keep looking and probably find the utility somewhere to extract it. At any rate, it explained the XARG parameter format.

> there's no Atari monitor which does this, are there any multi-sync
> alternatives?

The difficulty in finding a monitor that can display all TT
modes relies in the fact, that the high resolution mode uses
an ECL signal for better picture quality.
This is equivalent to TTL but the same signal is lead to the
monitor twice: one time directly, one time inverted.
This way influences on the cable by other electric devices
can be eliminated by simply reinverting one and then adding the
two signals.

The signal for the lower resolutions is standard analog VGA
so any VGA monitor can be connected to the TT. I don't know
if such a monitor will synchronize to the ST-resolutions, too.
Naturally, any multisync monitor can be used and will catch
all resolutions besides 'TT high'.

The only monitor that provides _both_, ECL _and_ full multisync
capability and that is available here in Germany is the
Eizo 6500 21-inch greyscale monitor (at $ 2000, I think, at least
here it costs about DM 3500).
You need an additional switch box to connect it to the TT if
you want to display _all_ resolutions. ($ 50 or so).
The TTM194 shipped by Atari _can't_ display the lower resolutions
because it's _no_multisync_ (same story as with the SM124 on an ST).
The Atari monitor costs about DM 2000 ($ 1200 or so).

Hope, that helps.
PMH

P.S. I'm going to buy a TT and this Eizo monitor in a few weeks.
If you can aford it - get it ! The picture's great and the
2 inches larger screen really does it. Small Text is readable
much better than on Atari's 19-inch monitor.

3868. Tank Battle game (saw on PC)

Newsgroup: comp.sys.atari.st
Date: 1991-05-09 18:13:06 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <6354@vela.acs.oakland.edu>
Source record: 232263

I saw a nifty little game the other day for the PC in which you
set up a certain number of players (computer or human) and each gets a
colored tank and some shells, and are dropped onto a hillscape.

The players then must calculate barrel angle and shell power
to take out the other players (taking the wind speed and direction into
effect). As you gain points (by destroying the opponent(s)) you gain
money and can buy extra and better weapons, including dirtballs, explosives,
chain reaction inducers (to eat away the landscape), and nukes. There are
even weapons quidance systems to enhance your accuracy. Destroying the enemy
can also give a wild display of sights and sounds depending on how well they
were hit, and occasionally the fall-out can even hurt yourself.

First off, has anyone seen this game that can help me with the name,
and second, is it available for the ST? I would appreciate any help that I can
get, and will be looking forward to replies.

Thanks

swood

This is a badly confused accounting of the extended-argument stuff going
around for TOS. ARGV and MWC's trick are nearly identical; ARGV is a
superset which adds validation that the args in your environment are really
intended for you. This is the method that's approved by Atari Corp. (at
least by THIS part of Atari) and it's the method used by Bammi's GCC tools,
Gulam (if you set env_style mw), and MiNT's shell, among others.

XARG may or may not be endorsed by Atari Germany, but nobody here at Atari
in Sunnyvale (to my knowledge) has endorsed it. The reason I hate it is
that you have to poke through your parent's data space to find your
arguments, and that is a no-no. It will be a much bigger no-no when memory
protection and/or virtual memory come along. ARGV has no such problems.

I don't know where the ARGV spec is -- I'll try to dig up a copy of it
and post it again.

>(5 of them, 3 ST and 2 TT). It's called the PTC-something-or-other.

You don't really need multisynch. All of the color modes use the same
timing. I believe the PTC is a little flexible, but the timings it will
accept are not wide enough to be considered "multisynch." Something which
is VGA-only is good enough, but for standard VGA the picture dimensions and
dot pitch will be off: everything comes out tall and skinny. Atari's
"near-VGA" differs from VGA in that the picture is wider and the pixels are
nearly square in 320x200 (ST LOW), 640x400 (ST HIGH), and 640x480 (TT MED).

3871. 4 meg 1040STE vs Mega4STE

Newsgroup: comp.sys.atari.st
Date: 1991-05-09 19:25:34 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <24497@know.pws.bull.com>
Source record: 232265

Netters were asking about the difference between a 4 meg 1040STE and the Mega4STE. Since I am an Atari dealer, I feel qualified to answer this one.

I retail the 1040STE with an SM124 monitor for $CDN 679. To boost this to 4 megs costs about another $CDN200. Since external hard disks are a must, adding an ICD FA.ST 85 costs $CDN 999. Total cost for the system (8 MHz, TOS 1.6) = $1878.

I retail the Mega1STE with SM124 for $CDN1079. For an additional $CDN 699, the buyer gets an ICD host adapter, an 85 meg Seagate ST1096N and 4 megs or RAM for a total cost of $CDN1778, cheaper than the 1040 system because it costs a lot less for an internal HD. This system also has a detached keyboard, a 16 MHz CPU and TOS 2.n. Best of all, with the VME slot, there are many boards, such as video cards, that are available for the MegaSTE (see ZNET posting 91-15 or 91-16, cannot remember which one).

The Mega4STE with a 48 meg SCSI bundled from Atari sells for $CDN 1879 because it costs me more to buy this bundle from Atari than it does to build my own systems.

I recommend the purchase of a Mega STE unless the user wants to stick with a floppy system.

Finally, this posting is not for commercial purposes, therefore, I have not mentioned my company name. It was posted for information only to help netters make informed choices.

ST Informer did a review of the stuff at the Cebit fair, and mentioned and showed pictures of the Matrix boards' output. There are three boards, each VME or Mega bus compatible. I don't have the specs on the boards with me, but one is 800x600 with 256 colors out of 16.7million. Another is a super-hi-res monochrome, and the final is the same super-hi-res but in 16 colors. They mentioned that Rio Computers in Las Vegas will be importing them. They also said that someone had a VGA-like board, with something like 1024x768 with 16 colors.

Lexicor software is supposed to have their own board out soon. The ISAC board has been shipping for some time. I think it may only be Megabus compatible, but I'm not sure. You can find it for around $600. BTW, there used to be a Parsec 'board' which was actually a unit by itself. Anyone know whatever became of it?

3874. ARGV spec repost as promised

Newsgroup: comp.sys.atari.st
Date: 1991-05-09 21:18:36 UTC
From: apratt@atari.UUCP
Message-ID: <2934@atari.UUCP>
Source record: 232290
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

In a discussion about Pexec and command lines, the question of the ARGV standard came up. Here is our documentation on this convention. It dates from August 22, 1990.

GEMDOS EXTENDED ARGUMENT (ARGV) SPECIFICATION

Introduction

The Pexec() function of GEMDOS allows a program to pass to a child process a command line up to 125 characters long, with arguments separated by spaces. No provision is made in GEMDOS for the child to know its own name. This makes it difficult for C programs to correctly fill in argv[0], the standard place where a C program finds the command which invoked it. Because the command line arguments are separated by spaces, it is difficult to pass an argument with an embedded space. This document will specify a method of passing arguments which allows arbitrary argument length, embedded spaces, and support for argv[0].

Standard Argument Passing

The Pexec Cookbook specifies how to use Pexec() to launch a child process, passing a command tail (argument string) and an environment. Before getting into the extended argument scheme, let's review how arguments are normally passed to a child.

A parent process builds a command line into an argument string - a null terminated string whose first byte contains the length of the rest of the string - and its address is passed as one of the arguments to Pexec(). GEMDOS copies this argument string to the basepage which it creates for the child. Thus the parent is responsible for gathering all the child's arguments into one string. This is normally handled by a library exec() function. The child is responsible for parsing the string of space-separated arguments back into an array of strings. This parsing is normally handled by the child's startup code.

Evolution

Several methods of bypassing the limits imposed by Pexec() have been used by GEMDOS programs. Some allow a user to specify a file on the command line which contains the rest of the arguments. Others get a pointer to the arguments, or the arguments themselves, from the environment string. Most MS-DOS programs use a command file for the extra arguments. This can be inconvenient for a user, cluttering the file system with command files, and making the operation of batch files and makefiles more confusing.

Several "standards" have arisen on the ST which use the environment to pass arguments. While more convenient than command files, these standards have other problems. Some rely on sharing memory between parent and child processes. Some take advantage of undocumented features of the operating system to get argv[0]. Others give the child process no way to validate that the arguments it finds are intended for it.

Rationale

In order to pass more than the standard 125 characters worth of arguments to a child, or to let the child find its name, the parent must place the extra information in a place where the child can access it safely and legally. The most convenient place is in the child's environment string. An environment string is a series of null-terminated strings of the format "VARIABLE=value" (e.g. PATH=c:\bin,c:\etc, or ShellP=YES). The last null-terminated string in the environment is followed by a zero byte, thus two consecutive nulls indicates the end of the environment. The environment is allocated for the child by GEMDOS, it is owned by the child, and its contents can be specified by the parent.

The child must have some way of knowing that the arguments which it finds in its environment are intended for it. The child may have been invoked by a parent which does not conform to this specification. Such a parent would leave _its_ arguments in the environment, and could pass that environment on to the child. The child would mistakenly interpret its parent's arguments as its own.

Placing arguments in the environment passed to the child gets around all of the command line limits of the standard Pexec() command tail. Because there is no limit on the length of the environment, arbitrary length arguments are supported. Arguments placed in the environment are null terminated, so they may contain spaces. A parent can also place the name of the command with which it invokes the child in the child's environment, providing support for argv[0]. Validation of the extended arguments can be placed in the standard Pexec() command line, by assigning a special meaning to an invalid length byte.

The GEMDOS Extended Argument Specification

This specification uses the convention that the presence of an environment variable named ARGV (all upper case) indicates that extended arguments are being passed to the child in its environment. This means that ARGV is a "boolean" environment variable. For the purpose of this specification, its value is not significant, but its presence indicates that the strings following it are the arguments for the child. Implementations of this specification are free to give the ARGV environment variable any value. The ARGV environment variable must be the last one in the environment passed to the child, so that the child can truncate its environment at that point, and treat everything before the ARGV as environment, and everything after it as arguments.

The first argument to the child (argv[0]) is the first string in the environment after the ARGV variable. This argument is the "pathname" parameter passed by the parent to Pexec(). The remaining arguments are those that the child would normally find in the command tail in its basepage. Even if all of the arguments would normally fit in a child's command tail, the parent should set up the arguments in the environment to take advantage of the benefits of this extended argument scheme.

As many arguments as will fit in the command tail will be passed there as well as in the environment, to support non-conforming programs. As a flag that arguments are also in the environment, the length byte of the command tail will be 127 (hex 7f). Non-conforming programs should not have a problem with this length byte, because it is longer than the maximum 125 bytes allowed by Pexec().

As an aside, the Pexec Cookbook erroneously implies that a command line can be 126 or 127 characters long. In fact, GEMDOS only copies to the child's basepage up to 125 bytes, or until it encounters a null, from the argument string passed to Pexec(). It ignores the length byte, placing a null at the same place it found one or at the 126th byte if no null is found. This has several implications: the length byte is not validated by GEMDOS (necessitating validation in the child's startup code, but also making this extended argument spec possible), and the null terminator _can_ be located after the end of the real command tail (the Desktop places a CR character after the command tail and before the null). The ARGSTART.S startup code listing below demonstrates how to correctly validate and parse a GEMDOS command tail.

A child which finds an ARGV environment variable can use the command tail length byte value of 127 to validate that the arguments following the variable are valid, and not just left over from a non-conforming parent which left its own ARGV arguments in the environment.

Because the strings in the environment following an ARGV variable are not environment variables, a child should truncate its own environment at the ARGV variable by changing the 'A' to a null.

Implementation: Parental Responsibilities

To pass arguments in the environment, a parent must create an environment string for the child. This can be achieved by first allocating as much space as is used in the parent's own environment, plus enough room for the ARGV variable and the arguments to the child, and then copying the parent's environment to the newly allocated area. Next, the ARGV variable must be appended, since it must be the last variable in the child's environment string. Following the ARGV variable is the null-terminated pathname of the child as passed to Pexec(), then the null-terminated arguments to the child, followed by a final null byte indicating the end of the environment.

After setting up the arguments in the environment, the parent must place as many arguments as it can fit in the command tail it passes to Pexec(). This way, a child which does not conform to this

specification can still get arguments from the command tail in its basepage. When placing arguments in the environment, the parent must set the first (length) byte of the command tail to 127 (hex 7f), validating the arguments in the environment.

Here is an example execv() library routine in C. It uses three local utility routines, e_strlen(), e_strcpy(), and str0cpy() for getting environment size and copying strings into the environment created for the child.

```
/* EXECV.C - example execv() library routine
* ============================================================
* 890910 kbad
*/

long Malloc( long nbytes );
long Pexec( short mode, char *filename, char *tail, char *env );
long Mfree( void *address );

/* Return the total length of the characters and null terminators in
* an array of strings.
* `strings' is an array of pointers to strings, with a null pointer
* as the last element.
*/
static long
e_strlen( char *strings[] )
{
char *pstring;
long length = 0;

while( *strings != 0 ) { /* Until reaching null pointer, */
pstring = *strings++; /* get a string pointer, */
do { /* find the length of this string, */
++length; /* using do-while to count the */
} while( *pstring++ != 0 ); /* null terminator. */
}
return length; /* Return total length of all strings */
}

/* Copy a string, including the null terminator, and return a pointer
* to the end of the destination string.
*/
static char *
str0cpy( char *dest, char *source )
{
do { /* use do-while to include null terminator */
*dest++ = *source;
} while( *source++ != 0 );
return dest;
}
```

```
/* Copy an array of strings into an environment string, and return a pointer
* to the end of the environment string.
* `strings' is an array of pointers to strings with a null pointer
* as the last element.
* `envstring' points to the environment string.
*/
static char *
e_strcpy( char *envstring, char *strings[] )
{
while( *strings != 0 ) {
envstring = str0cpy( envstring, *strings );
++strings;
}
return envstring; /* Return end of environment string */
}

/* Run a program, passing it arguments according to the
* GEMDOS Extended Argument Spec.
*
* `childname' is the relative path\filename of the child to execute.
* `args' is an array of pointers to strings to be used as arguments
* to the child. The last array element must be a null pointer.
* `environ' is a global array of pointers to strings
* which make up the caller's environment.
*/
long
execv( char *childname, char *args[] )
{
long envsize, ret;
char *parg, *penvargs, *childenv, *pchildenv;
short lentail;
char argch, tail[128], *ptail;
static char argvar[] = "ARGV=";
extern char *environ[];

/*
* Find out how much memory we'll need for the child's environment
*/
envsize = e_strlen( environ ); /* length of environment */
envsize += e_strlen( args ); /* plus command tail args */
/* plus length of argv[0] */
parg = childname;
do { /* use do-while to include null terminator */
++envsize;
} while( *parg++ != 0 );
/* plus length of ARGV environment variable and final null */
envsize += 7;
envsize += envsize & 1; /* even # of bytes */
/*
* Allocate and fill in the child's environment
*/
ret = Malloc( envsize );
```

```
if( ret < 0 )
return ret; /* Malloc error */
childenv = (char *)ret;
pchildenv = e_strcpy( childenv, environ ); /* copy caller environment */
pchildenv = str0cpy( pchildenv, argvar ); /* append ARGV variable */
pchildenv = str0cpy( pchildenv, childname ); /* append argv[0] */
penvargs = pchildenv; /* save start of args */
pchildenv = e_strcpy( pchildenv, args ); /* append args */
*pchildenv = 0; /* terminate environment */
/* put as much in the command tail as will fit */
lentail = 0;
ptail = &tail[1];
while( (lentail++ < 126) && (penvargs < pchildenv) ) {
argch = *penvargs++;
if( argch == 0 ) {
*ptail++ = ' ';
} else {
*ptail++ = argch;
}
}
/* terminate command tail and validate ARGV */
*ptail = 0;
tail[0] = 127;
/*
* Execute child, returning the return code from Pexec()
*/
ret = Pexec( 0, childname, tail, childenv );
Mfree( childenv );
return ret;
}
/* End of execv() example code */
```

Implementation: Prenatal Responsibilities

A program's startup code must handle getting extended arguments out of the environment. The startup code should get the basepage pointer off the stack, then get the environment pointer from the basepage, and search the environment for "ARGV=". If "ARGV=" is found, the command line length byte in the basepage is checked. If the command line length byte is 127, then the arguments in the environment are valid. The first argument begins after the first null following the "ARGV=". It is important not to assume that the null follows immediately after the "ARGV=", because some implementations may assign a value to the ARGV environment variable. After setting up an array of pointers to the arguments, the startup code should set the 'A' of the "ARGV" variable to null, thus separating the environment from the argument strings (remember: a double null terminates the environment).

Here is some example C startup code which shows how a child could look for arguments in its environment:

```
* ARGSTART.S - example C startup code
* using GEMDOS Extended Argument Specification

bcs.s valen
move d1,d2 ; if invalid length, copy all of tail
valen: clr.b 0(a2,d2) ; null tail because desktop inserts <cr>
moveq #' ',d1 ; space terminator
get1: move.b (a2)+,d2 ; null byte?
beq.s argok ; if so, we're done
cmp.b d1,d2 ; strip leading spaces
beq.s get1
subq #1,a2 ; unstrip start char
move.l a2,(a1)+ ; and store that arg
get2: move.b (a2)+,d2 ; next char
beq.s argok ; if null, we're done
cmp.b d1,d2 ; if not space...
bne.s get2 ; keep looking
clr.b -1(a2) ; terminate argv[argc] in the command tail
bra.s get1 ; get next arg
argok: clr.l (a1)+ ; terminate argv[]
* --- allocate stack
move.l a1,_stklimit ; end of env/arg vectors is stack limit
add.l _stksize,a1 ; allocate _stksize bytes of stack
move.l a1,sp ; set initial stack pointer
* --- release unused memory
sub.l a5,a1 ; size to keep
move.l a1,-(sp)
move.l a5,-(sp) ; base of block to shrink
pea $4a0000 ; Mshrink fn code + junk word of 0
trap #1
lea 12(sp),sp ; pop args
```

```
*
* Everything beyond here depends on implementation.
* At this point, _environ points to envp[], _argvecs points to argv[],
* and _stklimit points to the end of the argv array. Thus argc can
* be calculated as ((_stklimit-_argvecs)/4)-1.
* _main could be invoked as follows:
*
move.l a5,-(sp) ; basepage
move.l _environ,-(sp) ; envp[]
move.l _argvecs,-(sp) ; argv[]
move.l _stklimit,d0 ; 4 bytes past end of argv[]
sub.l (sp),d0 ; (argc+1) * sizeof( char * )
asr.l #2,d0 ; argc+1
subq #1,d0 ; argc
move d0,-(sp)
jsr _main ; call mainline
lea 14(sp),sp ; pop args
```

A Final Note

This specification was formulated with careful deliberation, and with input from several companies and developers who have created development tools for GEMDOS. The Mark Williams extended argument passing scheme was the main influence for this specification, because it has been in use, and supported by Mark Williams and other companies for several years. This specification is very similar to the Mark Williams scheme, with the following important exceptions:

1) Under the specification, the arguments after the ARGV environment variable may be validated by checking the command tail length byte. The Mark Williams execve() library function uses the command tail length byte as a telltale, but it is not checked by the crts0 startup code. This validation is important for the reasons mentioned in the Rationale section above.

2) The specification allows the ARGV environment variable to take on any value. Mark Williams uses the value of ARGV as an iovector, which is described in the Mark Williams documentation. The iovector should no longer be needed, as its primary purpose was to simplify the MWC implementation of the C library function isatty().

3) Some versions of the MWC startup code do not require the ARGV= to have an `='. Because ARGV is an actual environment variable in the specification, the equals character is required.

3875. Extended Argument Passing Scheme

3877. Mark Choi's USENET ST mail order service.....

Newsgroup: comp.sys.atari.st
Date: 1991-05-09 21:48:06 UTC
From: scale@abode.wciu.edu
Message-ID: <1991May9.214806.2258@abode.wciu.edu>
Source record: 232271

Hi Mark,
I have a few thoughts about your idea of a "USENET
ST mail order service". It's not that I think it is a bad idea, I feel
that it raises some complicated questions though.

Mark Choi recently wrote.....

$ Question: Does anyone think this goes against USENET ethics about
$commercial advertsing, etc.?

Any way one looks at it, it still comes down to being a commercial
venture being promoted through the public networks; and granted I am not an
expert on UseNet ethics, but hasn't these types of ventures been either
frowned upon, restricted or not allowed? We've all seen many commercial
publishers here on the networks, although they have been typically
providing technical support and service information; not pitching thier
products.
Now let's assume that such a service is "allowed". Does this mean
that one vendor is selected as the singular official UseNet ST supplier; or
establish c.s.a.st as an open marketplace where any vendor can freely
provide thier services to the network? How would this be fairly decided?
I do not see any easy answers.
I'll be honest with everyone here; yes, I am biased. As a
computer dealer, I take a great interest in the subject. As I am sure that
other dealers, manufacturers and publishers; would appreciate being able to
openly and freely advertise, solicite orders and sell thier products here
on the public networks. Realistically however, I doubt that this would
happen; I am also unsure whether it good for the network or not.
Like I mentioned earlier, it is not a bad idea; I just doubt that
there would be a way to implement the idea to fairly satisfy all concerned
parties. Of course these are my own ramblings, there may be something that
I have not thought of. Any suggestions would be welcome, bye.....

>compiled the program with Sozobon C and I was wonder if this is a
>specific problem with Sozobon. Or is there something I don't know
>about exiting from GEM?

I found the answer yesterday! Many thanks to all who responded.
In fact, though nobody identified the problem exactly, the tip off
was when someone recommended that I try compiling my "initialization"
and "clean exit" sequences separately to make sure the problem was
in that area. In fact, it made me think a bit more about my code
structure. Almost all my testing included saving a file before
exiting. Since the file saved properly, I assumed that that code
was correct. But it occurred to me that at the end of the routine
I usually 'fflush()' the buffer at the end before returning. In
fact, I was wondering if I forgot to put it in the code. Well, it
was there alright, but the problem was that it should NOT have
been there this time. 'fflush()' is only used when you have a
path that's been 'fopen()'d and is pointed to with a type FILE.
The path I was using had been openned by 'open()' and the pointer
was a type 'int'. The surprising thing is that I didn't seem to
have any crash problems when I ran my program from a text Shell.
Oh well. It's party time! :-)

3879. Atari MegaST BUSS - Pinouts

Newsgroup: comp.sys.atari.st
Date: 1991-05-09 22:26:49 UTC
From: rdt154k@monu6.cc.monash.edu.au
Message-ID: <1991May9.222649.10034@monu6.cc.monash.edu.au>
Source record: 232274

As there has been some discussion on the Mega ST internal bus of late
the following post briefly details the bus connections and what each
pins function is. Refer to any MC68000 data book for more info.
What is presented has been abreviated slightly but no
vital information was edited out. The whole document runs for about 10
pages, most of it esoteric, dealing with Atari's reasons for the bus and
copyright info plus a lengthy Introduction on the design of the bus. No real
information. Hope this is of help. If you have any queries please don't
hesitate to call me. Best of luck.

As to whether this is legal or not - I don't know. If problems do arise
as to the legality please inform me as I don't want to cause any serious
problems. Some parts are copied (ie; typed in by hand, by myself) verbatim
from the original documents.

---------------------------<cut here>---------------------------------------

Atari Mega ST internal bus.

Mechanical Description:

Two sizes of expansion card are supported. One, the half card
is half the depth of the Mega St unit. The other, the full
card is the full depth of the unit. In either case, the card
butts up to the rear panel of the St unit which has been provided with a
removeable hatch through which connectors and/or cables can be mounted.

The expansion card connects to the St motherboard through a 64
pin connector mounted on the bottom (solder) side of the expansion board.
This connector plugs directly into its mate mounted on the motherboard.
Standoffs, 25mm in length, are mounted into the bottom case through the
motherboard. the expansion card is then screwed down to the standoffs.
The standoffs and screws are not supplied with the Mega St and thus should
be included with the expansion card. A hole located in the left rear of
the expansion card fits around a plastic stud to provide extra strain
relief for rear mounting connectors (See diagrams).

Electrical Description:

The signals provided on the 64 pin connector are essentially the
pins of the 68000 processor. These signals are all unbuffered. They are
intended to drive one LS TTL load on the expansion board. driving more than
one load or driving excessive capacitance may cause imporper St operation.
For this reason it is not acceptable to connect to the expansion connector
in any manner other than the one outlined in the previous section (e.g.
connecting directly with a cable is not acceptable.

The bus may be arbitrated away from the processor using the normal 68000 protocol. However, the bus grant signal provided on the connector is the end of the daisy chain. Response time will be effected by the DMA going on in the system (e.g. disk activity, hardware bit-blt transfers, etc). If the peripheral requires DMA to occur while interrupts are enabled, care must be taken to limit the transfers to bursts of less than about 50 bus cycles allowing adequate time between bursts to process the interupts.

The timing of the bus is that of any 8Mhz 68k processor. Since the signals provided are essentially the processor pins, connecting peripherals in the same manner as you would to any 8Mhz 68k should work with no problem. DMA is the exception. The bus cycle produced even while the bus is arbitrated away from the processor must look exactly like an 8Mhz 68k bus cycle. This constraint is necessary to provide the proper sharing of the memory between the processor and the video. In all transfers, DTACK must be provided/sampled as required by the 68k processor specification. Also, transfers may not last more than 64 clock cycles. The St will automatically generate a bus error if AS is held low for more than 64 clock cycles.

The following diagram shows a top view of the connector on the motherboard with its associated pin numbers and signal names. This connector (TRW no. 009-00002-8, JAE no. ME03-R64P-D4T2-A1 or equivalent) is the male side. The expansion board uses the female side (TRW no. 009-00005-6, JAE no. ME03-64S-D4R1-A1 or equivalent).

<front of ST rear of ST>

Top view of motherboard connector.

The following is a brief description of each signal on the connector.
For more detailed info consult a 68000 processor manual.

CLK

This signal is an 8.0106Mhz TTL compatible, 50% duty cycle square wave.

/RESET, /HALT

In combination these two signals can be used to indicate a system
reset. The /RESET can be used by itself to indicate a system or s/w
reset (RESET instruction executed). These are both bidirectional
(open collector) signal terminated on the motherboard with a 1K and
a 4K7 pullup respectively. They may be driven according to standard
68000 processor timing to acheive the functions of the 68000's
/RESET and /HALT lines.

A system reset will occur at powerup and any time the reset switch
is pressed. It causes both lines to go low for at least 1ms. A
software reset will cause only the /RESET line to go low for
approximately 15us.

A1-A23

These lines provide the 23-bit address directly from the 68000
processor. Terminated with 4K7 pullups on the motherboard.

D0-D15

16 bit bidirectional data bus. Terminated with 10K pullups on the
motherboard.

FC0, FC1, FC2

These lines indicate the processor status for the current bus cycle.
They are directly driven by the 68000 processor. Terminated by 10K
pullups on the motherboard.

/AS

When low, indicates valid address on address bus. Terminated with
4K7 pullups on motherboard.

R//W

When high, processor is doing a read. When low, processor is doing
A write. Terminated with 4K7 pullups on motherboard.

/UDS, /LDS

/UDS indicates upper 8 bits, ie; D8-D15. /LDS indicates lower 8 bits,
ie; D0-D7. Terminated with 4K7 pullups on motherboard.

/DTACK

Bidirectional signal used to indicate a completed data transfer.
Terminated on motherboard with a 1K pullup

/BERR

Used to tell the processor or DMA device that no peripheral device
has reponded to the current bus cycle. The ST will automatically
generate this signal if a bus cycle does not complete within 64 clock
cycles. Terminated on motherboard with 4K7 pullup.

E

Enable clock used for 6800 peripherals. 60/40 duty cycle.

/VPA

Open collector line used to indicate that a 6800 type cycle should
be executed. Terminated by 4K7 pullup.

/VMA

This signal is used to synchronise 6800 type bus transfers with the
E clock.

/BR

Indicates that the bus will be released at the end of the current
bus cycle. This signal is daisy chained through the other DMA
devices on the motherboard, it does not come directly from the
processor.

/BGACK

Open collector signal used by a DMA device to claim bus mastership.
Terminated by 4K7 pullup on motherboard. Should also be terminated
on expansion board with another 4K7 pullup.

/NMI, /INT-5, /INT-3

These signals are used to asynchronously generate a level 7, level 5
or level 3 interrupt. These are the only levels which can be generated
externally. If they all occur simultaneously, the highest priority
(level 7) will be acknowledged first. The expansion card is responsible
for responding to any interrupt acknowledges for interrupts which it
generates. These acknowledges can be either vectored or auto-vectored.
All three lines are terminated by a 1K pullup on the motherboard.

Power:

Power is supplied to the expansion card through a pigtail cable which plugs onto a six pin connector on the motherboard. The connector on the mother-board is AMP no. 171825-6. The mating connector on the pigtail from the expansion borad is AMP no. 171822-6. The drive capabilities are as follows;

PIN 1 - +5VDC @ 750mA
PIN 2 - +5VDC
PIN 3 - GND
PIN 4 - GND
PIN 5 - GND
PIN 6 - +12VDC @ 500mA

Software Considerations:

The mediation of available addresses should not be necessary since only one expansion card may be plugged in at any one time. Atari has set aside the addresses C00000 through CFFFFF, FF0000 through FF7FFF and FFFE00 through FFFFFD for use by outside developers. Spurious accesses to FFFFFE/FFFFFF may be generated.

You can't add RAM which will work as video memory and/or will allow DMA. Also if memory is extended on the expansion card, the operating system will not clear it or allow it to be allocated.

3880. 1040ST FLASHBACK backup restoration?

Newsgroup: comp.sys.atari.st
Date: 1991-05-09 23:52:53 UTC
From: terryb.bbs@shark.cs.fau.edu
Message-ID: <uueP21w163w@shark.cs.fau.edu>
Source record: 232275

A friend of mine uses an Atari 1040 ST as a POS terminal in her business. I don't know the full story, but for some reason the hard disk was reformatted by an employee. The disk had her customer mailing list, inventory, etc. on it. They tell me the drive was backed up first using a program called FLASHBACK. But the copy of FLASHBACK on the hard drive is gone.

1) Anyway to "unformat" the hard drive?
2) Anywhere to get FLASHBACK or a compatible to restore the drive?

Failing these, there is a program called RWALL.ZIP in IBMHW forum on Compuserve that says it lets a PC read and write ST disks. Could the backup up disks be read onto a PC and the customer data extracted into ASCII files somehow?

P.S.: I am completely unfamiliar with Atari machines, but familiar with IBM and compatibles.

thanx
terry

Has anyone ever connected a Mega keyboard to a STFM style machine (STe, 1040, 520STFM, etc.)? Could a hack be constructed so that the original keyboard is left intact, but also have the detachable Mega keyboard?

3882. Re: Info about the Windsor Atari Show

Newsgroup: comp.sys.atari.st
Date: 1991-05-10 00:57:09 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <42171@cup.portal.com>
Source record: 232201

One of the best parts of the Windsor/Detroit International Atarifest was the big, central area shared by Atari US/Canada and Sav-Tek, a large Canadian Atari dealer...

There were literally mounds of boxes of TT030s, Mega STe 1s, Mega STe 4s, STacys, STes, and much more...

The prices were simply amazing... the last TT030 went for a special price of $2195..!

In addition, support for the show from Atari Canada was very strong... they provided over 20 complete computer systems for the developers and exhibitors to use during the show, including TT030s and Mega STes.

Good show, Atari...!

I'm not associated with them, but I'm sure they'll replace the disk, or help you figure out what's wrong..

Their phone number is (313) 973-8825 if you'd like to call them, or their address is: Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108

I'll see if I can find out if there's anything different about that one file for you...

Why don't we have a propper standard, one of the problems is that
Ataries HDX standard came out far to late.
So why don't all the other Atari developers come up with one
common standard.
Is it not posible to follow the MS-DOS standard, as our disks are
based on that standard..
It would only take a small patch program to fixup the none standard
disk partitions, and for the other developers to fixup there Booters,
or is this to simple a task.

Also are BIG partition standard ?.

I know Rio/Datel in Las Vegas was supposed to be importing it from England.
I do know they were charging $1495 for the ParSec alone, which is a bit steep for a 1024x768x16 color display (granted it is TI34010 based and runs off any ST and has VRAM, expandability, SCSI ports, and RS432 (?) ports, etc... making it a computer in its own right, kind of like Video Toaster)

Well, there's not point in adopting yet another standard now. Atari has
released the details of their standard for adding partitions and for
creating large (big GEM - BGM) partitions. Registered developers can get
this document right now. The new driver comes with all TTs so we might as
well use its standard.

> Francisco Figueirido
> email: figuei@lutece.rutgers.edu

I don't know whether this would work, but there is a SCSI to ESDI converter.
The ADAPTEC 4525 controller does this. And as some drives already use an
ADAPTEC 4070 or 4000 controller to convert SCSI to ST506, this may be a
feasible solution. I'd contact ICD or Supra and find out whether there boards
support the ADAPTEC 4525. I do know for a fact that they support 4000/4070.

Let me know how this goes ....

Perhaps they don't want the two formats to be mixed up by users.
Anyway, the two points you made are two of the reasons I wrote my own
driver. Especially (1) is extremely annoying.

I think you will have to post the text of your entry- and exit code,
because there is no problem with sozobon, I compiled some GEM programs
with sozobon and they run without problems.

and now something completely different:
The Larch

Some time ago people asked for example GEM programs. To get a bit used
to GEM I wrote a relatively small and not very useful text-viewer.
Because it is small I think other people can understand it, it contains
comments.
Subjects covered:
evnt_multi, wind_..., vst_height, v_gtext, vro_cpfm, etc.
multiple windows with the 8x8 font
keystrokes do not necessarily go to the top windiw, but to the
one under the mouse.

Another program simulates the Xwindow style of multi clicking.
(Ever tried to three-double click with GEM :-(.)

If anyone is interested I will send they to comp.sources.a.s

It's the first one. The program locked up _after_ pressing the "real" (the
last one) exit button and _before_ the file select box comes up.

I renamed it to .prg, too. It did work fine, then. I entered all my
birthdays, got all saved and now I'm happy. For the .acc, I'll try it
with a blank environment next days as soon as I find the time.

The true limit for Pexec() is 124 characters. If you need more, should use the ARGV method, as documented by Atari and used in many *nix-like shells.

BASH doesn't have much in the way of built-in utilities. For example, the
rather simple 'ls' or 'cat' commands are missing. When I tested BASH under
MINT, I was thankful that I had Allan Pratt's 'MINT'-ized utilities (available
on the atari.archive server as AKPUTIL7.ZOO in the mint directory.)

Agreed agreed and agreed again. It is even in Spaf's regular new user
questions postings!

Craig is now 11, so this thing has been going for 4 years.

If the bonehead CEO's at the place that first posted this want to ring
me (in the UK) for verificattion of this then my number is below.

(Perhaps we should all send cards to Cliff Stoll? :-)

The next release of Arcgsh will offer a graphical user interface for tar
and compress. Futher Arcgsh versions may provide support for additional
archivers, provided of course that running versions of the archivers in
question exist for the ST.

The old TOS doesn't map the bad sectors either. Actually, I heard that
it does recognize the bad sectors, but it doesn't actually 'save the
bad sector configuration' to disk; so, it knows they're there, but
doesn't permanently write them. Anyway, I wonder if this is fixed in
TOS >1.4.

DC Format 3.02 does good bad sector mapping.

I asked Dan Wilga about adding a bad sector mapping feature to NeoDesk's
formatter, and he told me just to throw out the disk. :^)

>I do not see any easy answers.

Using c.s.a.st or any other newsgroup as a source of free advertising would be a definite no-no. But what's the objection to operating a mail-order business entirely via email (i.e., catalogs mailed only to people who have explicitly requested them; all orders, confirmations, inquiries handled through email)? So far as I can see, Usenet commercial guidelines would have no bearing at all on such a service. (Individual sites might have objections about their users using email resources in this fashion, but that's up to them to deal with.)

3913. Publishers

Newsgroup: comp.sys.atari.st
Date: 1991-05-10 18:56:52 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991May10.185652.19983@lsuc.on.ca>
Source record: 232239

I've just finished a program and magazine article and I sent it off to STart Magazine. So right now, I'm planning my next bit of work and I'm wondering which direction I'm going to work towards. The biggest problem is deciding marketing methods.

1. Shareware: I'm getting more and more convinced that this is a bad idea. It's not just a matter of how little money most shareware publishers are getting. I think there's a much more important problem. For the last decade, "the big lie" in the computer field was the availability of tons and tons of "Public Domain" software. Ask yourself whether you were told this by somebody back when you were deciding whether to buy your first computer. "There's so much you can do" and "all you have to do is buy a computer!" Absolute B*llsh*t! You had to do *much* more than just buy a computer. And furthermore, if you looked into the situation, there simply wasn't "tons and tons of Public Domain" software. Oh, there was a lot of software that people were telling you was Public Domain, but if you really looked into it, and did some digging around, like phoning some of the authors of so-called Public Domain software, often it was "ripped off" software or software with specific limitations on how you could use it. Some of the authors I've contacted were irate about the mis-use of their software. Shareware just succeeds in muddying the water even more. There are so many variations of restrictions on re-distribution and usage of software, most BBS sysops who care at all about legalities are even reaching the point where they can't be bothered worrying about it anymore. This could get so bad that we'll see the publishers getting the police out confiscating equipment. They already have been to a small extent.

On Usenet, this is even more obnoxious. The basic concept of all networks is "you scratch my back and I'll scratch yours." That is to say, I'll do you the favour of carrying your files to other people and you do the same for me. In the News style systems this goes further: "I'll help you with your problems, and give you valuable information, if you'll help me, someday." That is to say we share the information because we *all* get something out of it, or at least expect to. Stating it further, we should expect to get equal "benefit" for the help we give others -- both in terms of advice and in terms of files. When you demand payment from people based on whether they are a "commercial site", for example, you're really snubbing them. It's like your saying "you are 'allowed' to see me picking your pocket as you pay for the transfer and storage of my file, but if you want any 'benefit' for having done so, you'll have to pay me extra!" And the

bigger joke is that this "commercial" site may be some individual working hard just to make ends meet getting a small time consulting company off the ground with less disposable cash than some student sitting in an EDU site paid for by his/her parents!

In the long run, there's no real justification for having *any* restrictions on *any* files posted to a newsgroup. Even the GNU "copyleft" is nothing by hypocritical masterbation in that sense. I will do my best to "respect" such restrictions, but I believe it is only right to post TRUE PUBLIC DOMAIN files in Usenet Newsgroups.

2. Traditional Publishers: The cost of packaging an "store shelf" product is pretty high. It seems to me that only the most widely popular products are worth marketting this way.

3. Magazines: Magazines can justify the inclusion of much small programs and programs of less general interest because over a year a subscriber can count on finding *some* programs of interest.

STart Magazine, for all the criticism levelled against it, has paid good rates to writers, making many of the lesser programs viable. Furthermore, because it integrated a "store shelf" publishing business with its "magazine disk" business, it was possible for people like Tom Hudson and Jim Kent to develop large bodies of programs which they might not have had the opportunity to develop in other ways.

Many other magazines crow about their "Public Domain" disks, but they don't *pay*. As such, they survive off the scroungings from BBS files and "crippleware" demo files. As such, they are really not doing much to promote real development. Don't expect to see the "next Tom Hudson" working for them. At best they may get some good stuff from people living off the money of others -- more students living off their parents and such. Now if you're a student you might want to submit something to them, but what good is it *really* going to do you? Reputation? To an extent, you can take your reputation from such publications and a buck and buy a cuppa coffee. A career? Forget it. I've done so much free work over the years you could wallpaper a shopping mall with the printouts. The only thing it gets you is more requests to do more free work.

Anyway, as you can see, my belief is clearly that the only "good" ways to market software are either "store shelf" or magazine, and if by magazine, one that *pays*.

But that leads me to wonder who's left in the Atari Publishing world? In particular, which magazines are paying for programs and what happens if I want to develop a program further? All I've seen lately in North America for paying work is STart Magazine. The other stuff seem to all be "fanzine" and beg for contributions. Pay? Money? "Why aren't you glad for the opportunity to do something for others? [#define others the-publisher]"

Also, exactly what *did* happen at STart? Did they sell off
all their "store shelf" business or is "The Catalogue" still
part of their overall business? I haven't seen ads for it lately.

O.K., here's the scoop, for all those interested. Although I only got three messages frowning on this, and at least twenty that wanted me to do it right away, the problems with the idea, both those of ethics and policy, and those put forward by Luis Outomuro seem to indicate that this is not the best way to go about this. This does not mean that I have abandoned the idea, if only to get more Atari product out there. Profit? Huh? For the amount of time I will have to put into this, I will be losing money, but here goes:
several folks suggested that I have a mailing list, and that I put together a catalogue. The problem with this is that then I would just be a true mail order service, and might as well jack up prices and just go for it. I do not have the time or inclination to go into hard/software retail anymore (I almost became an ST authorized business center, a while back). But here is what I will do. I will not have a catalogue. I do not have the time to compile one, nor do I have them time to write reviews. You will have to rely on what info you can get. You are on USENET, so use it. subscribe to Z-net's fine online mag! However, I will keep my e-mail address available for people to ask for prices, and I will e-mail them my responses. I may even post my real address and phone, if that becomes necessary. You can email me for a specific thing, or you can get on my mailing list for my "news brief". Unlike a real catalogue, it will contain only new things, and things of great interest. Bit by bit, I may add older things to the list, to eventually have a more catalogue like list, but not right away. Rest assured that I probably can get whatever old title you need, in my news brief or not, if it is still being distributed by the publisher. I will have some hardware: cpu's, modems, etc. as well. But like I said, this is not a business venture, just a favor to those who can not find a dealer. In fact, I would appreciate it if those who live near dealers would buy stuff from them. If you don't like their price, haggle it down, but buy it from them! I doubt that I will really affect them at all, though. In fact, if it ever got so large that it looked like it might, I would probably stop altogether. I have other things to do, you know. I really only expect a few orders a week.

So.... As I wait for my neural network to settle into the correct pattern of activations so I can take a screen snapshot, and finish my real work, I shall finish this post. If you are interested on getting on this list, e-mail me. It may take a while to compile, though. If you want something specific, ask, and I'll see. All those who expressed their desire for me to do this are already on the list. I will not advertise on the net. I agree with Luis that this is a mistake, and I never intended to do so. If no one minds, I will just post a "Anyone need something they can't find type of message every now and then. No

prices, not specific products, etc. I will also read "xxx Wanted" posts. Any advertising at all will have to come from "word of finger" from satisfied folks out there, or advice for those who ask for something. I will not solicit this, though, as I would rather spend my time riding my bike!
Now, is there any problem for anyone out there with this method? Please tell me about it. I do not wish to offend anyone. Not the users of c.s.a.st, especially not those who are themselves dealers (hi Luis!) and not the "powers that be. Please e-mail me with any problems any of you may have with this.

The particular version he is trying to use is a TOS port of bash. It
doesn't work too well, so I'm not surprised he's having trouble.

The point is still the same, though: I highly recommend using (the
MiNT version of) bash along with MiNT. If you have lots of memory.
Lots. And if you don't mind using ~250K every time you spawn a
subshell...

===== bad sector on formatting ====
Some formatters particularly the ones for hard disks writes FATs with bad sector locations. But new floppy disks are usually guaranteed to be all right and if you couldn't format them correctly, why not return them to the dealer? Or your drive mechanism may be dusty. Then why not take it to a service centre? I think it is a bad practice to allow bad sectors to exist right from the start.

But if there was a bad sector on your precious disk, then mark the location as bad using your favorite disk editor.

I would throw away the bad disk right away if that ever occurred. And if the drive does not work well, I'll just install a new one. Travelling and communication expenses are far greater.
Cheers.

From: cse0507@desire.wright.edu
Message-ID: <1991May10.174747.3574@desire.wright.edu>
Source record: 232074

Wanna know how to bomb TOS 1.4 (and maybe others)? Put two windows on the screen, and click the close box on the top one three times EXTREMELY quickly. I can just get in three clicks before AES (or whoever) says it's not there anymore. Bam. Top window closes, lower gets the raise signal. Bam. It closes. Boomity boom boom, can't close any more windows, can we?

Seriously, has anybody else been able to do this? I'm using the (much-maligned) Naksha mouse, with the double click speed and key rates cranked way up, and I can usually only do it when I've got a few liters of caffiend in me :-). Standard desktop, 2.5 megs, and a rev. c 520. Is it me, or is it memorex? If anybody out there has dug into the ROMs, like say one of the programmers of TOS (hi a.p.), what happens internally when there's another close window event on a valid close box, *but when the time comes to close it, IT AIN'T THERE?

Flames off, please. Come visit me and I'll demo it for you (and I'll spend the next six hours unborrowing sody pop :-).

It's already at atari.archive, as PATCH302.LZH and NEOQUEUE.LZH.

Thanks to the person who uploaded it!

Heehee, my buddy with the shiny new TT has received his Wordflair II. The funny thing is, the "print" item is grayed out because 2mb is not enough memory for the program to print (to his Atari laser). Sheesh!

As a side note, he says that Wordflair II looks great (on the screen).

There is a mono-only game for the ST called Baller that is something like
what you are describing. You shoot cannon, and must determine angle and
powder charge. It is German, quite fun, and should be on atari.archive.

>GNU "copyleft" is nothing by hypocritical masterbation in that sense.
>I will do my best to "respect" such restrictions, but I believe
>it is only right to post TRUE PUBLIC DOMAIN files in Usenet Newsgroups.

These days, as you point out, "Shareware" is essentially the same as freeware, in that the author gets about enough money to buy a sandwich as thanks for distributing the software. However, you have to be careful about equating shareware/freeware with so-called "public domain" software and documents. "Public domain," of course, implies that anyone can do whatever they want with it, including use it verbatim in their own programs, magazine, etc. (At least that's impression I get.)

It only takes one company/person/group "stealing" the fruits of your labors (where "stealing" could be a lot of different things) before you realize how important copyright notices, distribution restrictions, etc. are.

I've mentioned this before, but I'll restate it for the benefit of those who are relatively new to this group: As many readers know, I've been editing the "ST Picture Formats List" since 1988. It has involved a great deal of work on the part of lots of Usenet folks (by no means just me). If it weren't for the cooperation and generosity of the contributors, there would be NO reference guide to picture formats on the ST.

But until 1990, I had no copyright on there, no distribution restrictions, etc. because I assumed that anyone printing the list would give us all credit. After all, what's the big deal in saying, "This was created by the following Atari Usenet readers: [names]"? Or for that matter, why edit out the credits in the first place?

Well, someone (nameless) plagiarzed it outright. They printed it, made money off it, and didn't give any of us credit. In fact, they implied they'd written it out of the goodness of their hearts. How sweet.

The point is, there _are_ people out there who are unethical. Even something as "simple" as an electronically published FREE document must

be protected.

So there is ABSOLUTELY good reason to put distribution restrictions
and copyright notices on would-be public domain materials, even
documents. The fact that "legal wording" muddies the water is
no excuse to ignore it.

I don't want people stealing stuff I write/edit/distribute for FREE
and making money off it. Period. If I wanted people to have to
pay money for it, I would have distributed it through commercial
channels. As an example, I'm sure a magazine would have bought
the Picture Formats List as a serial or mini-column, and I could
have made some $$$ off it. That, however, was not my intention;
I just wanted to help out other ST programmers. The thanks we
all got for our efforts was to have someone plagiarze it and
charge other people for the information. So there are two
sides to the issue, and the issue is by no means simple.

> Many other magazines crow about their "Public Domain" disks,
>but they don't *pay*. As such, they survive off the scroungings
>from BBS files and "crippleware" demo files. As such, they are
>really not doing much to promote real development.

Agreed. But do they have any responsibility to encourage
development? I view magazines that don't encourage software
development (and/or steal things outright) as rags. I'm sure
I'm not alone there, and that's one of the things that separates
a rag from a quality publication, in my opinion.

>Don't expect to see the "next Tom Hudson" working for them.

The whole Antic Software/STart magazine thing struck me as
conflict of interest. While I don't remember any blatant
STart magazine plugs of Antic Software, it's still hard
to imagine a magazine claiming to be unbiased when it has
a 14 page catalog of its own software. Again, just my opinion.

> I've done so much free work
>over the years you could wallpaper a shopping mall with the
>printouts. The only thing it gets you is more requests to do
>more free work.

If you do free work for reputation or money or pretty much anything in
the "personal gain" category, you're doing it for the wrong reason,
IMHO. If you help others in the hope that your attitude will encourage
the others whom you've helped to do the same, then you're probably
going to be happier about the whole situation. I still think that kind
of attitude is contagious; maybe I just haven't been doing it long
enough to become cynical about it.

Of course there is some satisfication just in seeing other people
use your software/documentation as well.

> Anyway, as you can see, my belief is clearly that the only
>"good" ways to market software are either "store shelf" or magazine,
>and if by magazine, one that *pays*.

I can see why one would have that feeling, but I don't think it has to be quite so black-and-white. If you whip up a little utility to convert FOO to BAR, or turn the screen sideways, then what's the big deal about making it available for free? If you put many hours of work into something, then perhaps you'll be willing to go to the trouble of writing it up for a magazine. I usually prefer to have immediate distribution, instead of waiting N+1 months for the final product to appear in stores/magazines.

I just managed to squeeze GNU Emacs 18.55 onto my
Atari Mega ST2's drive, and when I ran it, it loaded the
elisp files through keydefs.el and then printed:
"Exhausted Pure Lisp Storage".
Can anyone help me squash this annoying message? This also
seemingly prevents a ^Z suspend, ^X^C Kill emacs, and
M-x suspend-emacs. (In other words, the only way I can
leave Emacs is to reboot the system.) Please?

I assume he has GDOS (or G+PLUS) installed before he runs WordFlair II.
(It _is_ required in order to print, but I'm sure that he realizes this.)

When the Atari laser needs to print, it snatches 1 meg of memory from the
computer. Thus if he wants to print to his laser printer on a two meg
system, he in effect is limited to using only one meg for the program
itself. Tell him to remove all desk accessories and all the fonts he
doesn't need in order to conserve memory. The manual gives details on how
to do these things to save memory.

Of course, you could also suggest that he add more RAM to his system.
Really, a TT shouldn't have only two megs of memory... It's quite
limiting. The nice thing about having lots of memory is not having to
worry about those things. :-)

Not much. It fixes a few minor bugs, and installs the hooks for Gribnif's new NeoDesk Accessories. One lets you open up a NeoDesk desktop inside any GEM application. I ordered it for $10 from Gribnif.

I got word of the upgrade from ST Informer, and I think ZNET and STR both had press releases on it.

While writing to Dieter Fiebelkorn to tell him how great his GEM-View program is, the phantom typist appeared, so I played around with it a while. For those who like following this guy (the phantom, not Dieter :^), here's some info: I have an STe, with no special stuff except for a lot in the AUTO folder. I knew I had struck the phantom when I typed something in STeno and the computer typed it again. I typed some more stuff on the keyboard, but it didn't appear on the screen. I moved the mouse and the stuff I typed appeared on the screen. I typed some more, moved the mouse, and the letters appeared. The only way I could get keyboard input to work is when I moved the mouse afterwards.

Well I do hope we get better support for LZH. ie. like support for
lzh11318, or with the possibility to select the command line for the
different LZH's.

I have fould some problems Arcgsh with ZOO, things did not work and
ended up using ZooBoy

Why is it we have all these problems with LZH. like number of files
that can be lzh, and only 2 folders deep,
Are there lzh's programs that don't have such severe limitations, or is
this a design limit of lzh.?.

I don't think you understood what I was on about, are you stating that we have to upgrade all our Programs and Hard Disk just because of the 'TT'.
The Supra standard was here far before the HDX one,
From what I have read ICD's booter is claimed to be the fastes,
I have seen boot problems with the HDX software, that where fixed by replacing the booter.
Also what states the Ataries Booter is the best..?
I don't think you should be rail roaded in what Atari gives you, I believe in freedom of choice, and not this dogmatic attitude that Atari gives you.

tmpargs[i++] = p;

_argc = i;
if ((_argv = (char **)Malloc((long)(1+i)*sizeof(char *))) == 0L)
```

```
_exit(-39); /* Out of memory - bye... */
_argv[i] = (char*)0;
while (--i > 0)
_argv[i] = tmpargs[i];
_argv[0] = "(none)";
}
} /* initargs */
```

```
o /
>--------X--snip snip snip-------
O \
```

Note that the routine _getenv() works just like getenv(), except it returns the start of the environment string (ie: given the environment string "EDITOR=vi", getenv("EDITOR") returns a pointer to "vi" and _getenv("EDITOR") returns a pointer to "EDITOR=vi". _getenv() is a internal routine to my libc, so you'll haveta poke around the guts of your libc to find the corresponding routine, if it exists.

> __ David Johnson Michigan State University

I seem to recall "way back in time" talk about memory
upgrades on a TT. Allan Pratt said there was no easy way
to add memory, that one couldn't simply add simm modules.
To upgrade to 4 or 8 megs, you have to purchase the
Atari daughter board (populated?). I recall something like
a $1300 list difference between a TT/2 and a TT/8. Are
people actually paying this? This seems way out of proportion.
$1300 for an additional 6 megs?

Like the users above, I can't imagine using an 030 with only
2 megs of RAM. Why did ATARI even make such an option?
If the machine was designed, as ATARI says, for power users..
CAD and DTP and engineering, it doesn't make much sense.

cheers!

Are there no TV type scan modes like the ST/STE , the 320*200 and
the 640*200 on the 'TT' ?.

I ask this is because I here comments like, you only need a VGA
monitor or you need a "multisynch".

I can see the reason for not having a true "mutisynch", if
the 'TT' has the one same scan rates as the ST's mono one,for all its
colour modes, but if the 'TT' has support for the ST's 320*200 and 640*200,
then I can see the need for a "multisynch" monitor, or should I be
saying a two synch monitor ?.

Your Help would be appreciated, may be you could give us details of
the scan rates..

>Hey, what was wrong with Neodesk 3.01? I am a registered owner, and I have
>not gotten any word of an upgrade? What did the patch fix?

Well, it fixes some minor bugs in window updates (sometimes windows didn't
get updated and the desktop showed thru parts of them) and a problem where
NeoQueue didn't do form feeds between files (even when asked to).

I found out about the patch when I reported the above problems to Dan Wilga
via e-mail, and got the patch off a local BBS when it showed up there about
a week ago.

I still find a minor window update bug in NeoDesk 3.02, and reported it (but
can live with it for now).

3940. NT/ST module compiler send to c.b.a.s

Newsgroup: comp.sys.atari.st
Date: 1991-05-11 18:51:47 UTC
From: micro@imada.ou.dk
Message-ID: <1991May11.185147.15710@imada.ou.dk>
Source record: 232054

Hi all,

I have just send this to comp.binaries.atari.st :

NT_COMP : a program to compile NoiseTracker/SoundTracker modules, and
play with standard samples.

The program is fully GEMmed and supports ST(e), TT and all resolutions.
The program comes with source to a player for the new segmented file
format. The player supports 8 bit samples on standard ST's and
real DMA sound on STe and TT. As bonus I have included a ST/TT com-
patible malloc (w. Mxalloc)

o The compiler uses 16 bit fractional numbers internally and sample
subsampling (interpolation) for the best possible sound!

o The segmented sample files uses no processor time when playing on
STe and TT! (even at 50KHz playing freq.)

-Klaus (micro@imada.ou.dk)

Jim Omura (lsuc!jimomura) posted recently in c.s.a.s. long diatribe
against different forms of software you can find on usenet, different
archives and bbs's. He is definitely against stuff where copyright
notice is included and somehow managed to convey a feeling that
nets are ripping him off.

This is exactly the same guy who just annouced that he used
copyrighted but free Sozobon C, which he got probably just from that
very net, to create a commercial (mildly commercial, mind you, but
still) application. He is also quietly forgetting that, apart of
original authors, quite a number of people chipped to the software
which he is using in by providing libraries, bug fixes, hand-holding,
storing, transfering and other form of support. Just to provide a
tool he is using and no "STart" would do that, for many diverse
reasons. On the top of it, he recently asked on the net for a help.
Even if his request really boiled down to "Help me! I don't know how
to program." he got this help and even acknowledged this. Therefore
I am finding his shrieks somewhat curious, inconsinstent with his
actions and a little bit brazen. Maybe he just had a bad day. But
why to vent somebodys bad humours all over the world?

Nope. The program cannot be made to print on his 2 meg TT. He has burned
up many dollars (in phone bills) to Atari discussing this with them.

>Of course, you could also suggest that he add more RAM to his system.
>Really, a TT shouldn't have only two megs of memory... It's quite
>limiting. The nice thing about having lots of memory is not having to
>worry about those things. :-)

Most of said phone calls deal with a memory upgrade, which has been promised
him on several dates (all of which are in the past). My point was that if
"a TT shouldn't have only two megs of memory..." they why are they selling
them with only two megs?!? A moot point, of course. He will soon get his
memory upgrade (snicker, shall we take bets?) and be happy ever after . . . .

>Any idea why? Fix? Is it a problem?

If you put a blank (non-autobooting) disk in drive A, you will find that
a) Your problem will go away
b) Your hard disk will be seen much quicker.
This is also a perfect place for an anti-virus bootsector (see VKILLER on
atari.archive). Also, you can automate your hard disk book by using a
program like SLEEP coupled with a program like COLDBOOT (from ICD). My
"boot" floppy has the following:

"screen" type anti-virus bootsector, which flashes "virus free disk" at
bootup
an auto folder containing:
sleep05.prg - makes the computer sleep for 5 seconds
coldboot.tos - cold boots the computer.

I just turn on both computer and hard disk at the same time, and about 11
seconds later I am looking at Neodesk 3.0.

>don't know which type to choose for the various Supra drives.

Suppose I have a Megafile 44 with a Quantum 105 connected to SCSI
controller in the M44 attached to a Mega 4 ST computer.

Can I use Atari HD tools to format the Quantum and/or the cartridges of the
M44?

actually we already have this configuration but we had great difficulty in
getting it to work, had to use ICD tools to format the Quantum.
The HD are know working with AHDI 3.01 as driver
but we still have the following problems:

- we cannot M44 cartridges with HDX 3.02
- On poweron off the system it takes several boot cycles before the HD's are
recognized.
After that everything works fine.

Does anybody knows a solution to our problems?
It should be possible to attach a SCSI drive to the internal SCSI controller
of the Megafile 44, shouldn't it?
(if possibly please reply by email, I can post the solution later)

Harold van Aalderen (hvaalde@cs.vu.nl) and his brother.

3949. Re: Converting Sparcstation .au files to Mac/Atari format

Newsgroup: comp.sys.atari.st
Date: 1991-05-12 17:30:27 UTC
From: dave@msb.com
Message-ID: <1991May12.173027.10784@msb.com>
Source record: 232224

Converting the .au samples is a snap. According to the audio man page on my system, the Sun audio data is 8 bit signed volume values. The high order bit is a sign bit. If set, the volume is positive (1's compliment), and if the sign bit is 0, the value is a negative volume (also 1's compliment).

In a C program reading the Sun audio data, stick this code in the middle of the conversion loop:

```
if(value & 128)
value = 128 + (127 - (value & 127));
```

See...baby food. If the sign bit isn't set, no conversion need be done. The resulting output is a volume level from 0 to 255 with 128 being the zero crossing. Multiply the result by a fraction if you want to change the volume before output.

I'll leave the headers up to you. I never monkeyed with that (the man page is rather cryptic about this), and besides, you wouldn't want me to take ALL the fun out of it, would you? ;-)

Maybe the G+Plus/TT/SLM combination just doesn't work (i.e., G+Plus isn't
fully TT-compatible). Have him try using GDOS with only one font
(and no desk accessories) to see if it will print on the laser.

Anyone, who is using the Uni-Man editor/librarian:

How can I get it started??? It is installed to my harddisk exactly the way manual tells me to, but when the bar that has the "Select 'Cancel' to..." appears, no file-selector appears, and after I have managed to get the drop-down bar to the screen, the drop downs do not work and the program goes sooner or later to eternal loop saying, "Something is wrong, save and try again" or something like that. Nothing sensible or useful can be done with it, it just does these things...

I have a Mega4, with two 85Mb Seagates hooked by ICD hostadapter, a HD-floppy and a DD-floppy, and the SLM 804. There is the TOS 1.4 in it. All this is installed in the Lighthouse Tower.

I have tried bootin up "clean" from floppy, but it does not work even then. Do things like harddisk-cache, extra folders, TOS bug-fix patches, HD-adapter or things like that affect?

Have you had any luck using this editor-librarian under MROS?

If I am forced to sell this program, because of compatibility problems, can you suggest any universal editor/librarian that can cope with Ensoniq VFX and Korg M3R, and runs under MROS with Cubase???
Please tell me where I can get one, I am familiar with importing things from US, Germany, UK etc...

Any help will be appreciated!!!

Jartsu

1.
Are there any MGR fonts anywhere? How do I use them? Is MGR a realistic
set-up to use, or is scren space too limited?

2.
Do I have to write in C, using the MGR libraries to write an MGR application?

TIA4info,
Warwick.

From: warwick@cs.uq.oz.au
Message-ID: <1328@uqcspe.cs.uq.oz.au>
Source record: 232056

I have written bindings to all the MiNT library functions, using
FTL Modula-2. It is a DEFINITION module, plus an assembler implementation,
so you'd need FTL or some sort of asm access (ie. not TDI) to use it.
It incorporates the calls Syield, etc., with appropriate data structures
and enumerated type declarations.

Mail me if you want it, then I'll know whether to post or email.

Ciao,
Warwick.

> ntomczak@vm.ucs.ualberta.ca

Oh, I didn't get that "feeling" at all.
The message I got was that his impression is that he cannot expect to make
a living (or even a part of one) by distributing products as shareware
because of the preponderence of individuals who feel no compunctions about
paying the author for the software they use and because of the preponderence
of individuals who feel no compunctions about distributing shareware in
ways that make it hard to tell what's shareware, what's freeware, and
what's public domain.

I gather that there are some authors who even today manages to defray
a small part of their development costs from shareware revenues,
but I also gather that that is less true today than it was for a while,
and in any case that quite a different story from meeting costs and
exceeding them enough to buy a sandwich or two.
So, my impression accords with what I believe is his impression.

This is not at all to say that "the nets are ripping [people] off".
As long as one understands from the outset that the ground rules only
allow for posting stuff pro bono, and posts stuff with that understanding,
one is not being ripped off. One who does not understand that, well,
is still not being ripped off, but is caught in a misconception.

What's disconcerting to me that while I can understand that Usenet
cannot be used as a vehicle for commercial enterprise, but *must*
be maintained as a pro bono vehicle, there is no reason why this
should be true of the commercial systems such as CIS, GEnie, etc,
yet this seems to be the case. That is, there does *not* seem to
be a commercial system which can be used as a vehicle for marketing
and selling software products. (Jim's article and maybe one of the

followups mentioned STart and a couple other systems. I know nothing
about them. Maybe one or more of them fulfills this need.)

>and post it again.
>
>==
>Opinions expressed above do not necessarily -- Allan Pratt, Atari Corp.
>reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

To clear up the confusion:

(1) The only extended argument passing scheme ever supported by Atari Germany
is the ARGV specification from Ken Badertscher.
(2) Gemini 1.0 used Dale Schumachers xArgs methode, because at that time there
was no other method.
(3) Newer Gemini versions use ARGV (as documented by Atari Corp.). xArgs is
maintained for backward compatibility with older tools.
(4) The Gemini distribution contains the official ARGV documentation in
sample\exarg.doc. This, I agree, should be 'ARGV.DOC'. Sigh!

take up so much. I have an old 1040 ST and an old 520 ST 1 mb and 512 k respectivly.
I would like to upgrade both thought the 1040 is a priority. My question is
which memory chips does the Atari ST use? I can get my hands on the bare chips.
Would I need a board or can I pggyback or is there room on the motherboard?
I need the chip type/nums too if anyone out there has them.
Secondly does anyone out there have Overscan installed with the actual
hardware modification? Is it worth it? What exactly does it do? And are there
any side effects possible? Could something end up not working or not displaying
write. I understand it is is irriversable. Is it perhhaps possible to install
a switch if there is any worry? I sit worht it is the bottom line?
Thats it for now. I know I will have more questiopns later...
Thanks in advance ...
Please, if possible, reply via Email it is much better for me. Thanks.

3967. Prospero Software Distributors - Summary

Newsgroup: comp.sys.atari.st
Date: 1991-05-13 16:39:37 UTC
From: erkamp@arc.ab.ca
Message-ID: <1991May13.163937.8374@arc.ab.ca>
Source record: 232069

Here is all the information I was able to acquire.

Bob

From: Prospero Software <prosof@cix.compulink.co.uk>

The latest versions are 2.153 for Fortran, and 1.144 for C. Both fix
all known 'incompatibilities' that occurred with TOS 1.4

The cost of updating to the current versions is 30 UK pounds, and the
master disks will need to be returned with payment (either by a
cheque drawn on a UK bank or by credit card) to the address below.

Regards
Paul Hargreaves.

Prospero Software Ltd.
190 Castelnau
London
SW13 9DH
England.

From: Stephen Harold Goldstein <steveg@CSEIC.SAIC.COM>

From the back of their Autumn 1989 newsletter:

Prospero Software Inc
100 Commercial Street, Suite 306
Portland, ME 04101 USA
(207) 874-0382
(207) 874-0942 (FAX)

In Canada, 2 distributors/dealers were also listed:

PBO Development Rosoft Distribution
1847 Baile Street, Montreal, PQ 3862 Lonsdale Avenue, N Vancouver,
Canada H3H 1PS BC, Canada V7N 3K6
(514) 931-7339 (604) 980-9365

I have called the US # and it has been disconnected. I then called PBO
Development and they do still handle Prospero Software though if you didn't buy
it from them they recommend you deal with Prospero UK directly. I don't know the
status of Rosoft Distribution. Also PBO Development says that Prospero doesn't
currently have a US Distributor and that Prospero is currently in a state of

transition with regard to their North American distributors. Looks to me the best bet is to deal directly with Prospero UK for the time being.

3968. GNU Make troubles: 2 bombs!

Newsgroup: comp.sys.atari.st
Date: 1991-05-13 17:18:35 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91May13191835@orion.laas.fr>
Source record: 232071
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I am trying to use GNU Make in order to control a LaTeX document.
This is GNU make v. 3.54 that comes off of atari.archive. The same
Makefile works on my Sun SPARC, but gives 2 bombs on my Mega 4 ST.
The Makefile replaces .SUFFIXES to be LaTex/TeX specific. It also
uses sub-directories:

```
PARAGRAPHS = $(patsubst %,$(DIR_P)/%.tex, $(PARAGRAPHS_LIST))
```

The rule that GNU make has trouble with seems to be the following:

```
%.bbl : %.bib $(DIR_P)/%.tex
-bibtex $*
if egrep -s "^(There were .* error messages)$$" $*.blg ; then \
touch $< ; fi
```

$DIR_P has the value "acm". When GNU make is run with -d it sees that
it should check in the subdirectory. But when wanting to do the
implicit dependencies for foobar.bbl, which are foobar.bib and
acm/foobar.tex, it tries also to look for either acm/SCCS/foobar.tex
or acm/RCS/foobar.tex. Immediately: 2 bombs! Earlier, it checked for
SCCS/foobar.tex and RCS/foobar.tex and coninued without aborting.

The problem might be the double directory structure. Has anybody else
used GNUMAKE for LaTeX and friends? Also, this GNUMAKE came with GCC
1.35 or 1.36. Maybe a more recent version is necessary.

Thanks to all,

> then I can see the need for a "multisynch" monitor, or should I be
>saying a two synch monitor ?.

Listen carefully:

>> You don't really need multisynch. All of the color modes use the same
>> timing.

All of the modes on the TT except 1280x960 use the same video timing.
All of the modes on the TT except 1280x960 use the same video timing.

They are different "resolutions" but they all pump video to the monitor
using the same horizontal and vertical timings. The 200-line modes
actually double the line data, so the monitor sees 400 lines. Because the
monitor is actually 480 lines high, there are 40-line margins at the top
and bottom. Thus, the monitor always sees 480 lines. The width of a pixel
is immeterial to the monitor, as long as it isn't smaller than the
electronics can handle: the 320-dot modes just have wider pixels than the
640-dot modes, but the timing is all the same.

Is this finally clear?

I recently acquired a TT030, but unfortunately, my beloved
19" Moniterm will not work with it, so I must sell it to
get a large screen TT monitor.

The Moniterm is 1280 x 960,
it requires a Mega,
and TOS 1.4.
(graphics card included)

Asking $1000, list price $2000...reasonable offers
accepted, but I reserve the right to refuse any offer.

Shipping not included.

For anyone wondering, trust me, it is worth it, I paid a lot
more and still thought it was worth it, I can't live without
it now, that is why I want one for my TT...

If you downloaded 'gcc139b.zoo' from 'gnustuff', everything should
have the correct version number.

It's on GEnie...and I'm sure is should be on Compuserve as well.

I can't upload to atari.archive, I don't have the ability yet.

Good luck in getting your stuff published in Start. If it does by some miracle, you will not get paid for it. As far as I have been able to tell, they have not been paying authors for a long time (including me). Start is going down real fast. They are not getting any advertising money - advertisers are staying away in droves. I actually heard recently they've been running some ads *for free* just to try and keep things alive. Bob Brodie is doing his new column for free. A great pity, Start's kinda all there is left in terms of mainstream Atari magazines in North America.

I only have two questions: (1) why would you WANT to bomb your machine?
(2) Why would you click three times in the first place?
Everything I know works with one or two clicks.

This strikes me as entertainment for those who couldn't afford Dungeon Master or something...

3980. TT problem + ST's for sale

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 05:22:20 UTC
From: apalmer@pyrtech.pyramid.com
Message-ID: <155368@pyramid.pyramid.com>
Source record: 232065
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This last weekend, I purchased a TT. After reading on c.s.a.st that the latest tos was 3.05, I was shocked to discover I had tos 3.01. The TT came in a unopened box that the dealer received about 12 days ago. Why the hell is the dos over 6 months old. If somebody from Atari reads this, I would appreciate a responce. Is there a way I can get an upgrade?

The reason for my concern is problems I'm having with file systems. Hanging off the dma port, I have 2 Quantum pro 80 and 1 Micro 1375. I have had three partitions develop directories that point to themselfs. This prevents show info from working. The directories appears to be infinitely deep. The drives use 1 ICD and 1 Supra hosts. (ICD->Pro80+Micro1375 Supra->Pro80)

I'm selling two of my old systems. I would like to sell them as systems, but I will consider all offers.

System 1

-1040STf w/tos1.4 + 2.5 megs (board can be upgraded to 4 megs <$100)
-SM124 mono monitor
-Quantun Pro80S 84meg 3 1/5 drive in Supra case
-Spectre 128 w/Mac roms - Macintosh Plus emulator
-Star SG10 printer
-IMG Scan image scanner
-LDW Basic compiler
-MicroLawyer
-DC Desktop
-Beckemeyer Hard Disk Toolkit
-Supra hard disk utilities
-Why Wait? floppy & hard disk cache + print spooler + ram disk
-SGS Switch program switcher
-.ACCess CLI
-Micro Kitchen Companion recipes on disk

All software has original docs. I will leave shareware and public domain on the hard drive. This would be a great system for someone thinking about buying a Mac. I'm asking $1200 for the complete system. If you have concern about buying a used harddrive, I will swap the new 50meg TT mech for the Quantun and knock $100 off the price.

System 2

-520ST w/tos1.4 + 1 meg + Z-Time clock chip + Mega keyboard
-CCC Learning Station case with 2 DS floppy drives
-SC1224 color monitor
-Rixon T212A 1200 baud modem

-ST Talk Professional telecommunications software
-Neo Desk
-pc-ditto 3.0 - IBM emulator
-Degas graphic arts system
-UMS Universal Military Simulator
-Dive Bomber
-All Aboard!
-Space Cutter
-Micro League Wrestling
-GATO
-Devon Aire

The CCC case is a metal case that holds two Atari floppy drives plus power supplies for the computer and drives. Everything, including the monitor, plugs into an internal power strip with an external power switch. The drives have the cheap mechanisms replaced with Epson mechs. I'm asking $600 for this system.

I also have about 10 Mega keyboards that I would like to sell. These are just the bare bones keyboards. They are a direct replacement for the keyboard in the original 520 without the internal floppy. I'm asking $40 each for the keyboards or 3 for $100.

If the above systems don't match your needs, I would be willing to rearrange the hardware and software to meet your needs. Just make an offer. All the hardware is in very good condition.

If you are interested in any of the above, please reply with e-mail or call me at (408) 992-0131. If I'm not home, leave a message and I will get back to you.

thanks,
al

>I think I'll get him a beetle mouse for father's day.

The reason I brought up the point about the MegaSTe mouse is that I think Atari is shipping a different kind of mouse with the STe and I was curious whether he thought his MegaSTe mouse was better than the one that came with his 1040.

Sheesh, I should've just said that in the first place. :^)

BTW, when did you get your MegaST4 and your dad get his?

My theory, and I have quite a few :^), is that Atari has stopped shipping different mice from different countries in their computers. It seems they have picked one manufacturer and stuck with them.

3982. Atari-st vs Atari-tt

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 07:03:40 UTC
From: geert@ahds.UUCP
Message-ID: <1986@ahds.UUCP>
Source record: 232079

Hi ST'ers and TT'ers.

I am a proud Mega-ST owner, but I wonder what the
major and minor differences are between the TT and the Mega-ST.
That the TT is twice as fast and that it has a build in
harddrive, I already know.

Is it worth it to get rid of my mega-ST and buy an TT or
must I wait for another machine to come up? Does all
ST software run on an TT?

Geert.

3983. Re: Is there an ESDI adapter for the Atari?

>ADAPTEC 4070 or 4000 controller to convert SCSI to ST506, this may be a
>feasible solution. I'd contact ICD or Supra and find out whether there boards
>support the ADAPTEC 4525. I do know for a fact that they support 4000/4070.

I use the adaptec 4525 controller. It has the advantage that there is a
jumper which allows it to mimic the 4000 controller to some extend.
This jumper will allow it to work with most of the standard ST harddisk
drivers, partition software etc.

In order to get this to work you'll need something to go from
ACSI (on the DMA port) to SCSI. I use a BMS 200 from Berkeley
microsystems for that. They also sell the 4525, and are quite
helpful. As stated before ICD and Supra also offer ACSI<->SCSi
adaptors, and maybe also 4525 adaptors.
I've never done business with them.

I believe a BMS 200 with adaptec 4520 (2 boards) was something between
$250,-- and $ 300,--. Comes with the cabling.
You'll have to supply the power supply, disk and housing, and to
assemble the stuff. Not too difficult.

Good luck!

3985. TOS filing system for MiNT

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 08:59:38 UTC
From: dpg@cs.nott.ac.uk
Message-ID: <1991May14.085938.23232@cs.nott.ac.uk>
Source record: 232100

I'm about to start work on an MeSsy-DOS filing system for MiNT, and would appreciate some advice about the way it should handle filenames. Some possabilities are:

1) Have it work just like TOS, ie. convert all names to uppercase internally.

2) Have filenames stored on disk as whatever case they were created with. This is the way the versions of MeSsy-DOS I've used work. Within the filing system, of course, all matching is case-insensitive, but programs calling Fsfirst() get mixed case.

3) As 2), but have programs running in MiNT domain get mixed case, programs in TOS domain get uppercase.

Any thoughts on the relative merits of these approaches? Any other ways of doing it?

Message-ID: <1991May14.170431.8126@cc.curtin.edu.au>
Source record: 232099

I have just sent the file cled122s.lzh to atari.archive (put it in ~atari/new)
This is the source code for a fully GEM based cassette box insert editor with
graphics, an executable is also included so you can see how it should work.
This is primarily posted as an example (not necesarily a good one) of how to
write a GEM based application. It uses multiple windows (with proper redraws),
the menu bar, a moveable toolbox on the background screen, dialogs, the file
selector etc. Feel free to use/modify any of my source. Compiles under both
GNU and Mark Williams C.

Rob (In my boss/lecturers account)

3987. Bad Sector on Formatting (was Re: Tos 1.4 Bugs)

It is true, other than real cheapo's, the defective floppy disk can be returned to the dealer. (Do you all save all your receipts? :-) Still, which formatters on the Atari do at least verify the formatted disk? Especially, MS-DOS compatible formatters; you get 4 extra sectors for free!

The only time I detected a defective floppy instantly was when Sector 0 was defective! Otherwise, you slowly fill up the floppy disk until you come to the defective spot. ;-(It would be nice to know that fact when the disk was formatted.

From: johnj@knor.prl.philips.nl
Message-ID: <2787@prles2.prl.philips.nl>
Source record: 232081

We had a small discussion of the phantom typist in c.s.a.st.tech
recently.

A more or less conclusion was that it occured after typing normal
text immediately after one or more backspace.

It seemed to be caused by inconsequent keyhandling procedures
within the application programs. However more investigation
is needed to say this for sure.

The background idea was that standard text characters were queued
when typed in while other keys like delete and backspace were not
queued within the program to help you not to delete too much.

..opions of course..

You might want to wait for an announcement / price quote for the SST68030 from Gadgets (the folks who brought you the Spectre Macintosh emulator). For about half the cost of a TT you can get a very nice 68030 with lots of fastRAM and compatibility with the ST -and- TT software. I can see about getting a copy of the on-line session David Small gave on GEnie last Wednesday dealing with the new hardware.

Depending on the application, a TT is four to six times faster
than a standard MegaST. I think you mix this up with the MegaSTE
which is about 60% faster than a standard ST.

>Is it worth it to get rid of my mega-ST and buy an TT or
>must I wait for another machine to come up? Does all
>ST software run on an TT?

I like the TT, and I usually recommend it if you have an
application that needs the power (TeX, for example). The major
applications run fine on the TT.

>As long as one understands from the outset that the ground rules only
>allow for posting stuff pro bono, and posts stuff with that understanding,
>one is not being ripped off. One who does not understand that, well,
>is still not being ripped off, but is caught in a misconception.

Well, essentially you've understood what I was saying, but
Michal wasn't entirely wrong about what I said either. I didn't
say that *I* was being ripped off, but that to an extent, yes,
sometimes people are being denied use of material from the Net
whereas they are being put to the expense of passing it around
and to that extent, they *can* claim to being ripped off. And
they are given the opportunity to actually see it happen, which
makes it quite brazen. Let's look at a specific example. As far

as I remember, Lattice used to be on the Net. I don't know if they still are, but I'm fairly sure they were a few years ago. Now Sozobon C is not "begware" at this time. That is to say, they are not asking for money for their current distribution, so please keep in mind that this is only hypothetical. Also, the Sozobon authors are *not* on the Net and never "sent it down the Net". But let's say that one of the authors of Sozobon had sent a copy of Sozobon C down the net with a request for $30.00. Not unreasonable, and not unusual. Now the 'lattice' site would have the great joy of passing on a product that was probably taking money from their sales, and being expect to pay themselves, in terms of connections facilities and storage, as well as messages assisting people later who use Sozobon C.

Now that's an extreme case. But 1 of the points I was making was that even the least restrictive restrictions are still going be a reduction of the value of the Net to *somebody*. And to an extent, we have generally agreed that we'll live with it. Me too, obviously. But that doesn't mean that there isn't a "better way."

What's interesting is that there are so many people who are "new" to the Net that this whole argument seems to be new to a lot of people. This is one of the oldest historical arguments on the Net. It may surprise many here, but there has *always* been a disagreement with posting of binary files, for example, if you don't post the source code. Why? Well, you are *supposed* to share your material with the widest possible number of people on the Net. Posting a binary which can't be ported to other machines was (and in many peoples opinion still is) a violation of Nettiquette. And "those people" are for the most part the very people who were the main builders of the Net. What do you think "those people" think when they see a file that is Binary, Copyrighted, and *demands* money?

It was this "free exchange" of information that was the very basis of the Net. And I think it's what makes it better than FidoNet, which was *not* based on this principle so much as it was based on the fact that they saw what was happening on the InterNet and realized that such a thing was good.

>What's disconcerting to me that while I can understand that Usenet
>*cannot* be used as a vehicle for commercial enterprise, but *must*
>be maintained as a pro bono vehicle, there is no reason why this
>should be true of the commercial systems such as CIS, GEnie, etc,
>yet this seems to be the case. That is, there does *not* seem to
>be a commercial system which can be used as a vehicle for marketing
>and selling software products. (Jim's article and maybe one of the
>followups mentioned STart and a couple other systems. I know nothing
>about them. Maybe one or more of them fulfills this need.)

Exactly true! But not simply because CIS, Genie, BIX and Delphi are commercial. That has nothing to do with it. The point is that

what *you* download from CIS is something that both you and CIS have agreed to be a part of. They are *not* sending you Sozobon C by using Lattices's expenses. The only people involved are you and CIS.

What I think a lot of people should do is stick a sign on their monitors and read it every now and then:

"The Net is NOT a BBS."

Anyway, this is really not that important to me, so hopefully, unless someone else is getting something out of it, it'll end soon.

> returned to the dealer. (Do you all save all your receipts? :-)
Some disks have labels that says "lifetime guarantee", i.e. they can be changed without a receipt. We return the defective products to the manufacturers here. And they know when the lot went to the market and determine if the floppy hasn't been used long.
> Still, which formatters on the Atari do at least verify the formatted
> disk? Especially, MS-DOS compatible formatters; you get 4 extra
> sectors for free!
Very few formatters (such as those that come with a disk editor) have their own routine for the actual formatting. Most of the formatters simply feed arbitrary parameters to a TOS formattng routine, which does the verify.
>
> The only time I detected a defective floppy instantly was when Sector

> you come to the defective spot. ;-(It would be nice to know that
> fact when the disk was formatted.
Fortunately maybe, I have never experienced using a defective disk in my life (since 1980 when I bought my own single sided 8" disks). I heard people like to spread dust (tiny rocks, they are) over their disks, use very poor drive mechanism, or are unaware of the insufficient power supply to the drive mechanism. I have experienced cases where read/write failed but neither the floppy nor the drive mechanism was to blame: the write current of previous head was too strong for the second write current to override. As long as we use the same type of drive mechanism with adequate and stable power supply, that can be avoided.

From: ccsg@lut.ac.uk
Message-ID: <1991May14.143805.3888@lut.ac.uk>
Source record: 232164

Organization : Loughborough University, UK.
Keywords:

Hello everybody, I just would like to answer to Thomas
about Gfa Raytrace Package. I don`t know all the tools in this Pack
but if you are a beginner I don`t think that Gfa Raytrace could bring
you a lot of very interesting things. Let me explain why: At first
Gfa Raytrace is really specific. You know that this software uses the
Raytrace technic to show pictures. Of course the result is very nice
but the calculation is very slow (1-5 Hrs sometimes...or sometimes
all the night). Moreover Gfa Raytrace uses a lot of colors and it`s
difficult to use this process in GFA. But if you want to use the
Gfa Raytrace pictures try to find a converter from GFA Raytrace to
Spectrum (It`s exist!) and then you can use a Spectrum 512 routine
to show your pictures. If you can`t find a routine try to find
a executable binary file which load the pictures. (And if you want
make a DEMO for instance you can use the instruction EXEC or PEXEC 0
to exec the binary file... look in your Gfa basic manual).

Well, what I can say now? I could maybe introduce
myself... I`m called Samuel Grosdemange and it`s the first time
I use USENET NEWS .More other I`m French and I`m 19 (So, I beg
your pardon for the mistakes... thanks in advance). I begin to
code in Assembler 68000 some DEMOS and we have made a crew in
France (in Epinal near Nancy near Strasbourg). The name of our
crew is Passion and if you want to contact us (It`s a call to all
coders and ST users all other the world) write to the following
adress:
Samuel Grosdemange
3,Rue des Ducs de Chatel
88000 PALLEGNEY
FRANCE

Now , Thomas I hope you could receive a few letters
explaining you what Gfa Raytrace offer as a programming tool.
Good Luck with yous Atari ST and write me.Good Bye!

Sam,

> sendb emulators/zest.lzh
>
> Is this correct?
Yes, so far so good.

However, since you're at a uucp site, you'll probably want to try
adding a path line, like the one you've listed in your .sig.

> The directory structure (if any now) is not very clear with the new index
> style.

You really don't think so? I've clearly listed the beginning
of each directory with the name and a colon (i.e.'games:'),
and I've clearly marked the end of each directory with something like
'/end of games directory/'. Are others having this trouble with the
Index? Perhaps we should just nuke the whole thing and go back to an ls -lR??
I'd be interested in any feedback anyone has on this.

4001. MiNT and Gemini...

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 16:31:56 UTC
From: jared%midiline.uucp@elroy.jpl.nasa.gov
Message-ID: <XR4X22w164w@midiline>
Source record: 232076

Can someone inform me a little bit more about these two 'system' DOS/TOS replacers, or whatever they're called. How well does MiNT do what it supposes to do, which is multi-tasking? I've played with Gemini, and love the new desktop setup, but is Gemini pirated at all, or is it truely an original new desktop replacement in the PD/Shareware distribution?

Is anyone using either of these programs as an entire replacement for their ST's OS? Tell me the differences, improvements, etc. I'm very interested in maxing out the Mega ST4 to it's capaciable limit in operation! Also, I need to know detailed instruction on how to install either of these programs into my ST, and know how to run them.

The documentation seems to point out that MiNT isn't complete in some way... some bugs or something? No longer am I interested in just the simplicity of GEM... I want P O W E R !!!

Golden Bear

P.S. Please reply to me in Email, as there are often too many messages in here to trudge through on any given day. Thanks!

4003. GemView and Uniterm

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 17:26:52 UTC
From: rcb@netcom.netcom.COM
Message-ID: <1991May14.172652.6795@netcom.COM>
Source record: 232114

Like many others, I've just recently downloaded GemView from c.b.a.s. and installed it as an ACC. I'm pretty impressed with it, especially the fact that it multi-tasks. However, I just noticed a problem with Uniterm which I never had before. The problem goes away if I remove GemView as an ACC.

When I move the mouse, I get the text cursor very briefly followed by the arrow cursor. With the arrow cursor, pressing a mouse button pops up the wrong menus and marking text doesn't work. Since I use the cut and paste feature of Uniterm a lot, that bothers me. Has anyone else noticed this? I post here because I'm not sure if this is a GemView problem or a Uniterm one.

Thanks,

At the Windsor Atari show, Dave Small said that he had tested System 7 on Spectre. It works, but he called the System 7 software "a dog." He said it was terribly slow and crashed often. I doubt that Spectre is to blame for the slowness and crashing. It may be that he was just using an unrefined pre-release version--or maybe Apple really messed up on System 7. I suppose one should check it out before getting it for their Spectre (or Mac, for that matter).

About a year ago, I captured the phantom typist in a session saved from Revolver (the task switching program that allows you to save and restore all memory from a virtual session created by that software). Thus, the phantom typist could be loaded at any time for inspection by anyone with a 4 Meg machine and the Revolver software. I posted an article and ftp'ed a file 'phantom.arc' to 'atari.archive', hoping someone more competent than I would be able to examine the situation in detail and discover once and for all what causes the phantom to appear. I never heard from anyone who even looked at the files. Maybe if some of the interest in it has rekindled, someone will check it out.

4009. gcc 139 from atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 20:53:00 UTC
From: Mick_Schmidt@hb.maus.de
Message-ID: <60536@hb.maus.de>
Source record: 232018

Hi everybody,

now that the cc1 is also available at a.a. I started to test the compiler by
running the gcc.ttp.
The results weren't very satisfying.

When I run gcc with the -v Option I get the following.

```
gcc version 1.39
cpp -v -undef -D__GNUC__ -Datarist -Dgem -Dm68k -D__atarist__ -D__gem__
-D__m68k__ golforga.c /tmp/cc100000.cpp
gcc: /tmp/cc100000.cpp: file not found
```

I presume cpp tries to create the temporary file but fails because of the
slash's which should be backslash's?!?

If I use cpp directly it can't find the include files, although I've set
GNULIB and GNUINC.

What am I doing wrong?
Just to stupid or has anyone else problems like that?

4010. Trackballs for sale!!!

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 20:56:08 UTC
From: al885@cleveland.Freenet.Edu
Message-ID: <1991May14.205608.7264@usenet.ins.cwru.edu>
Source record: 232105
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.marketplace

I am selling genuine Atari trackballs that have been modified for use with
the Atari ST or Amiga computers. They work exactly as a mouse and are
available for a limited time. These are NOT the bulky 2600 models. These
are smaller and have superior buttons to the 2600 version.

For a standard trackball (left mouse button only): $25

For a trackball plus (left and right mouse buttons and a 9 foot cord): $35

Both trackballs are totally compatable with the Atari ST or Amiga mouse.
Please specify if you want it for the ST or Amiga if you plan to order.

Please include $5 for postage and handling for each order.

If you are definately going to order, please let me know ahead of time
so I can process your order more quickly.

Just a reminder, if you are having problems with BART, you should send me (jon@atari.archive.umich.edu) a message. Jeff handles just about everything except BART, that's my domain.

4012. Patch302 mystery solved, finally.

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 21:11:30 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1991May14.211130.819@ecst.csuchico.edu>
Source record: 232117

Jeff Weiner@atari.archive deleted patch302.arc because someone had told
him that neoqueue.arc was a newer version. Neoqueue.arc only replaces
the neoqueue which is in patch302, not the entire patch!

Therefore, I have sent patch302.lzh to atari.archive. And it is .LZH, not
.ARC.

4013. PATCH302 gone from atari.archive: Please upload!

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 21:33:42 UTC
From: redmond+@cs.cmu.edu
Message-ID: <1991May14.213342.10487@cs.cmu.edu>
Source record: 232109

I've been in touch with Jeff Weiner, and the file to convert NeoDesk
3.01 to version 3.02 is gone from atari.archive.
It was accidentally deleted.

Would somebody please re-upload patch302.??? to atari.archive ?

Thanks,

Red/.

4015. Online Reader programs

Newsgroup: comp.sys.atari.st
Date: 1991-05-14 22:26:56 UTC
From: revpk@cellar.UUCP
Message-ID: <L8Jy24w164w@cellar.UUCP>
Source record: 232123

I finally got Usenet access here, and I've found that it takes a LOT
of time to work with-- as well as the fact that I'd rather not read every
message that comes along, so I wind up skipping messages.
There are terminal programs for IBMs and Macs that allow one to a)
leave the program running, b) it will dial out automatically, and capture the
necessary files, and c) present them to you later on. These programs also do
something else which marks them above the standard capture buffer: they
provide for tracking replies to messages.

In a sense, they present the info to he user as though they're still
on line, get the responses, and the next day they redial out and upload the
replies.

Are there any such programs for the ST? Or, conversely, are there any
script files that will allow Flash to do this?

Brian Siano-- no signoff text yet, but I'm working on it.

Unfortuneatly, System 7.0 doesn't work with the latest version of Dave Small's software version 3.0.

Although the boot up error is quite trivial, and you don't get a crash page just a missing resource box from the installation.

>so I can process your order more quickly.

Is this a commercial advertisement? I've seen this quite a few times in
the last several months.

In the first paragraph, he says "available for a limited time." How
limited?

In the last paragraph, he says he wants to know ahead of time so he "can
process your order more quickly."

I bring this up because of the recent discussion about the mini-e-mail-order
service Mark Choi (it was you, wasn't it?!) was going to set up.

I'll take my net.police badge off now.

4020. ct GIF to IFF converter on th ST

Newsgroup: comp.sys.atari.st
Date: 1991-05-15 02:20:16 UTC
From: neonman@ecst.csuchico.edu
Message-ID: <1991May15.022016.2792@ecst.csuchico.edu>
Source record: 232089

HELP!! I am looking for a GIF to IFF converter that will run on the ST.

If you know where to get one, let me know.

Also, If you know where to find a Giff viewer that will take from the
4906 color palet of ST STe, or ST with shifter, and convert it into a
Spc or SPu or NEO or anything that uses the 4096 color palet, Id
be interested in that too.

thanks.

4021. SCSI floppy specs

Newsgroup: comp.sys.atari.st
Date: 1991-05-15 03:27:36 UTC
From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <13024@uhccux.uhcc.Hawaii.Edu>
Source record: 232127

```
Here's some specs from Teac and Brier Technology brochures:

Teac 3.5" embedded SCSI floppy drive
-------------------------------------------------------------------------------
o Built-in SCSI interface reduce host computer loads

o Built-in 30KB data buffer makes transfer rates up to 556KB/s possible

o FD-235HS offers 2MB capacity and the FD-235JS, 4MB capacity

o Single +5V DC power operation

SCSI controller specs
-----------------------
data buffer: 30KB
terminator: mounted (removable)
SCSI ID: SCSI ID = 0 (when shipped)
Parity stop: On/Off possible (Off when shipped)

Drive specs
-----------------------
data transfer: 250Kb/s, 500Kb/s, 1Mb/s
rotation: 300rpm or 300/360rpm (FD-235JS)
average access time: 94ms
track-to-track seek: 3ms
settling time : 15ms
motor start time : 480ms or less
error rate : 10e-9 soft read, 10e-12 hard read, 10e-6 seek error

General
-----------------------
MTBF: 10,000 hours or more
MTTR: 30 min or less
Power requirements: +5V DC +- 10% (+12V DC supply unnecessary)
Power consumption: .45W typical standby, 1.6/1.85W read/write (FD-235JS)
Dimensions (WxHxD): 105x42x162mm (4.125x1.625x6.375in)

===============================================================================

Brier Technology Flextra 3.5" 25MB embedded-SCSI floppy drive
-------------------------------------------------------------------------------
o Twin Tier Tracking technology records precisely-positioned magnetic signal
on a barium ferrite disk to indicate where data is recorded. This is crit-
ical to STOR/MOR's high storage capacity

o Embedded servo/voice coil actuator
```

o Fast. Data access is on a par with fixed disks:
average access time: 35ms
track-to-track : 15ms
rpm : 720
data rate : 1.25MB/s

o Large data capacity: formats to 21.4MB

o Error rate: 1 in 10e9 correctable, 1 in 10e12 uncorrectable

o Dimensions (WxHxD): 4.000x1.625x5.750in

The drive is sold to OEMs in large quantity only. Q/Cor of Norcross, GA is packaging the 25MB Flextra 3020 in internal ($849), external ($995), and PS/2 ($1195) subsystems with everything necessary to plug and play with IBM PC computers. Additional disks are $30 each.

I have a chance to get an Atari 520ST (ST520?) with colour monitor,
mouse, and one disk drive for $250, and am looking for general
opinions on it, and have some specific questions, as well.

For one, can I had a hard drive to it?
Is its only operating system GEM? I am unfamiliar with it...
Can I add more memory? And what memory does it have?
Software! Is there much available?

Thanx for any info, big or small, anyone can offer

Please mail me directly, as I dont (yet?) read this news group

4023. 1040 ST fails ram test

Newsgroup: comp.sys.atari.st
Date: 1991-05-15 03:37:24 UTC
From: gathings@cs.utk.edu
Message-ID: <1991May15.033724.11656@cs.utk.edu>
Source record: 232128

I have just aquired a 1040 st and for some reason, it fails
the ram test for the next 512k bank.

I have 3 questions :

- What could cause this (besides the fact that I might not have
an extra 512k in the machine)

- Is there an earlier version of the 520 st that looks like
the 1040 st (the logo on my 1040 looks 'strange')

- Is there a fool-proof ram test prg. that I can use to make
sure I am not seeing things(I am using a pd version
right now)

Any replies or hints are welcome .

Golando

4024. mac emulator kit for atari st's

Newsgroup: comp.sys.atari.st
Date: 1991-05-15 03:53:42 UTC
From: gathings@cs.utk.edu
Message-ID: <1991May15.035342.12119@cs.utk.edu>
Source record: 232129

I am considering purchasing a mac -emulator kit for my 520 or 1040 st.
I have the following questions:

- what is the minimun system configuration one must have ?
- what are the limitations of such a system?
- what mac software will I be able to run ?
- will I need the original mac roms in order to
run the mac emulator?
- do anyone have an emulator to sell ?
- what price is too much ?
- is PC ditto (ibm emulator) a more economical
option to access a larger software base?
- will I be able to read mac disks ?

Thanks

Golando

Check out atari.archive in the printing/pbm/ directory. There's a whole slew of graphic conversion utilities for the ST. I don't know if there's a GIF->IFF converter though. The files there are huge as well: some are greater than 300K.

>Also, If you know where to find a Giff viewer that will take from the

Someone shoot me if I'm wrong, but I was under the impression that a new (with warranty), out of the box, Wico trackball with two buttons, nicely prepared for the Amiga, ran about $40 at Creative Computing in Santa Monica, CA. Considering this, why would anyone pay the same price for a hack???

Further, aren't the instructions for making these devices available on ab20.larc.nasa.gov's anonymous FTP-server?

Just here to give you ALL the information in order for all you buyers out there to make a more objective decision.

I like the new system of Indexing, but I have problems getting files from
Bart sometimes. It would be nice if their were some examples in the
"help" file that detailed how to get files through the e-mail system.
I've been using commands of the format "sendb dir/filename.ext
aa,ab,ac,ad,ae" and then hoping I would get the file. One file that I
have been consistantly unable to get is Overscan 3. I just never get a
response. The new system of indexing is quite clear, though.

>Mac, for that matter).

It must have been a beta-version. Nobody (except the guys who made it)
had the "golden copy" of system7 any earlier than a week or so before the
official release. If it was the sys7b4 release, it runs like a dog on even
Mac computers :). However, this makes me wonder: will the SST and the TT be
able to take advantage of the Virtual Memory handling of sys7? I ask this
because (and someone correct me if I'm wrong) I believe that Spectre (all
versions) emulate the Mac Plus, so if the sys7 uses system calls to determine
the hardware it is being run on, then maybe it will think it is using a 68k
rather than an '030 and therefore be unable to use the PMMU of the '030.

BTW, Dave (or anyone else in the know), have you fixed the TT cart.
port problem? I _think_ that was the problem that people were having
running Spectre 3.0 on TTs ... (again, correct me if I'm wrong....).

>
> Is there a parts joining script for rejoining the parts of a uuencoded
>binary or source file before uudecoding? I've just been doing it by hand and

I've been using the awk script that follows on our Unix systems successfully for quite a while. If you run it on a file that has all the parts of a distribution in it in numerical order, it'll strip the extraneous stuff out of it and output a file suitable for uudecoding.

To use it, you can paste it into a file called 'stripuue.awk', copy it into your News directory, and add this line to your .cshrc:

alias strip 'awk -f ~/News/stripuue.awk'

(To be able to use the shell alias immediately, type "source .cshrc" at the csh prompt.)

Thereafter, when you save a set of binaries/sources with the 's' command, you can use the same filename for each to effectively concatenate all the parts into one file (but make sure they are cat'ed in the correct order...sometimes part03 comes before part02, etc.)

Then you can just type something like:

strip filename > stripped.filename

and you should be able to uudecode the "stripped.filename" at that point without problems.

'stripuue.awk' follows:

```
-------Delete everything above this line, inclusive----------------
BEGIN { mode=0 }
$1!="table" && mode==0 { }
$1=="table" && mode==0 { mode=1; print $0 }
mode==1 && $1!="table" && $1!="include" { print $0 }
$1=="include" && mode==1 { mode=2; }
$1=="include" && mode==0 { mode=2; }

Is there such a thing as an AtariUUCP BBS program? I've only seen FidoNet capable BBS programs, and FidoNet does not come close to the amount of support of Usenet.

Also, can someone please explain what OS/9 is? Pardon my ignorance, but I've heard a bit about it, but what does it differ from GEM?

>
> Maybe the G+Plus/TT/SLM combination just doesn't work (i.e., G+Plus isn't
> fully TT-compatible). Have him try using GDOS with only one font
> (and no desk accessories) to see if it will print on the laser.

Charles Johnson wrote to me that G+PLUS does not work quite correctly with the TT unless you have the new version - version 1.5.

CodeHead will supply upgrades to users for $10 plus the old master disk.

This may or may not fix the printing problem, but it ought to be worth a try.

Good luck!

++ >Does the bash.ttp (The Bourne Again Shell) in "utilities/bash-bin.lzh" of
++ >atari.archive work? All I get is a useless prompt - I can't even cd.

++ Most likely your problem is that you are trying to run bash without mint.

Well, there are two versions of Bash floating round. One is Eric Smith's port, one is Edgar Roeder's. Eric's requires Mint running, Edgar's doesn't.

Bash is "just" a command line interpreter, file system utilities are not built in (they aren't in Eunuchs, from whence Bash originated). Hence you must have on your $PATH, the binaries "ls.ttp" "rm.ttp" "mv.ttp", etc, etc. Edgar's version of bash requires these utilities *NOT* to have a filename extension (i.e. the files must be named "ls", "rm" & "cp"). Eric's (as is more normal) wants these files to have one of the .ttp/.prg/.tos extensions signifying its executability. Edgar's Bash is UNIXMODE sensitive and can use long filenames, filenames with capitals and "dots" are a valid filename character (allowing "Makefile.atari.st" as a valid filename for example).

The other thing about bash is that it leans heavily on environmental variables, so remember to set them as required. For Edgar's Bash, ENVIRON.PRG will set up environment variables before you double-click Bash.

Cheers,

Graham

Warwick Allison writes:

++ 1. Are there any MGR fonts anywhere? How do I use them? Is MGR a realistic
++ set-up to use, or is scren space too limited?

?? Try "font n" where n is 1 through ~12. Check that you have font.prg in your mgr binaries. There're other fonts around. There're also files which define what fonts are available and which ones Mgr has access to. Check in $MGR/fonts (wherever that is on your system). Screen space is restrictive for anything over 12pt size, but then again, I don't have Overscan or Reflex.

++ 2. Do I have to write in C, using the MGR libraries to write an MGR
++ application?

In theory, no. The Mgr manual describes the ESC codes that can be used to communicate with Mgr. Personally, I haven't looked very closely into this yet but I managed to use Xlisp to output a few Mgr ESC codes which changed the screen somewhat.

Cheers,

Graham

The actual version of Overscan is called AutoSwitch-OverScan because you can configurate it to switch from the overscan-res. to the standard-res. if programs are to be started which do not run with non-standard-resolutions. There aren't any incompatibilities. In Germany AS-OverScan costs DM 120.

So long,
Patrick

Source record: 232119

bferrer@Bonnie.ICS.UCI.EDU writes:

>can't find d:\tmp/cc100000.s

I had that problem too. It seems that gcc had not fully been ported from
Unix, so some filespecs still use slashes.
However, the slashes arent really the problem since TOS can deal with
filenames containing slashes. So, the file mentioned above would have
the name `tmp/cc100000.s' and be in the root directory of drive d.
Since the part of the filename is longer than 8 chars, TOS runs into
trouble.

I didnt find a solution (maybe patching gcc.ttp could help). Try to get
hold of a newer gcc version (I have one that works).

Sorry

(This may be a repeat, but I didn't see it on the net)

I have several of these tape machines but very little
time to work on them. I would like to give one away
in exchange for a working interface.

I propose the deal to be :
You send me $40
I send you the stuff listed below
You send me working software + cable diagrams
I send you $40

Ongoing discussions as to functionality, problem solving
would be expected. etc.

Anyone interested?
Anybody want just a drive?

Archive Sidewinder 9045

Streaming Cartridge Tape Drive

- standard 1/4" tape cartridge
- 20 megabytes formatted per tape
- up to 90kbytes/sec transfer rate

- brand new units without cases (OEM models)
- approximately 4.6"x 8.7"x14"
- requires +24V @ 0.8 amp and +5V @ 4.5amps

- hardware interfacing is via :

```
| | xfer | |
| |-----------> | |
| | ack | |
| |<---------- | |
| | dirc | |
| |<---------- | |
| | reset | |
| |-----------> | |
|______| |___________|
```

- software interfacing is via an intelligent controller which accepts commands like :
o reset
o read status
o retension tape
o erase tape
o write
o read

- documentation includes :
o product discription
o operational specs
o controller operation
o host interface description and design guide
o flow charts and timing diagrams
o theory of operation manual
o maintenance manual
o trouble shooting
o complete schematics
o update notes from Archive

The Dumas uudecode with additions by myself and others will decode these files without editing out the headers (assuming that they are properly encoded). The file can be in one or multiple files.

It is available by anonymous ftp from cs.dal.ca in pub/bio/uud.tar.Z

As nobody has asked me to post my own port of GNU C, I'll be just guessing what has happened, but excuse me. It seems the environment string of TMPDIR or something is set as 'd:\tmp' instead of 'd:/tmp' or the compiler expects to be under some master such as MiNT or something which converts the filename delimiter (just guess).
I didn't know that TOS accepted slashes! I have thought only the newish DESKTOP command interpreter did so. Oh, no. Wolfram says slashes are part of the filename, not the delimiter. Quite right.

The filenames are usually stored somewhere called filename pools that cope with arbitrarily long names, various mount devices, file name links, symbolic links etc. Therefore the unix style filenames have very little in common with the 'real' name stored in the conventional part of the media called directory.

The filename pools can exist as part of the library or supplied by the operating system (command line interpreter can incorporate them) which could be running under some native OS such as TOS.

>money from their sales, and being expect to pay themselves, in
>terms of connections facilities and storage, as well as messages
>assisting people later who use Sozobon C.

Ahhh! Now that's the key issue, isn't it. That the net is actully cooperative anarchy, both in management and in cost-sharing, and that shareware that is "too good" actually takes money away from "real" companies.

A similar example of the "shareware that's too good" problem happens with games. Suppose Joe Freeware writes a perfect Tetris clone for the ST, and makes it free or shareware. Just having the game out there will hurt the sales of "BigSoft's" licensed, commercial, "official" version of the game that BigSoft paid oodles of money for the rights to distribute. In fact, a free clone that is substantially better than the "official" version could absolutely kill sales. I wonder if BigSoft could then sue the shareware author for loss of sales. I seem to remember something like this being discussed in comp.sys.amiga regarding Tetris and Spectrum Holobyte, but I don't know the details.

In that sense, it seems like you're right in saying that shareware is not a good idea. Even shareware products that are compltely original (and not just clones) may still hurt commercial software, and this is probably bad for the ST community in general, since reduced profitability from software sales makes good developers quit.

But unfortunately, the Tetris example above still applies to freeware, public domain, and public domain-with-souce-code (even more so, in fact).

And we are not alone here. This is something that's possibly going to happen in the music business too, as more and more people get home studios capable of producing CD-quality recordings. What a legal morass!

Nevertheless, what we DON'T want to see is a bunch of court cases against unknowing shareware authors. And we DON'T want zillions of restrictions on what can be written and distributed by shareware authors.

The optimal solution would be to encourage shareware authors to sell their best stuff. A great shareware program could be SOLD for a small fee (19.95 or so). If some authors don't want to spend their lives doing tech support, then perhaps a new class of "cheap-but-no-tech-support"

software should come about.

I imagine most shareware authors don't realize how they may be affecting the commerical market. If they did, they might go to the trouble of selling their software.

> What's interesting is that there are so many people who are
>"new" to the Net that this whole argument seems to be new to a lot

>are for the most part the very people who were the main builders
>of the Net. What do you think "those people" think when they see
>a file that is Binary, Copyrighted, and *demands* money?

One crucial point you're missing about the current situation in comp.sys.atari.st is that almost everything is "posted" via FTP now. I haven't posted anything to comp.binaries for ages. So no one can say that it's costing anyone anything to maintin my shareware files, except for the generous folks at atari.archive who have made it clear that they don't mind.

FTP is very different from "the Net" -- do you have the same feelings about things "posted" via FTP?

here is what i use, a unix csh script which calls the "dumas" uudecode (here called uude). it unpacked every binary/source posted to c.s.a.st and c.b.a.st:

```
#!/bin/csh
#
# NAME
# uud.sh -- script for uudecoding a split file
#
# SYNOPSIS
# uud file1 file2 ...
#

set file=$1
echo "doing file $1 (first one)..."

if ( $#argv > 1 ) then
# sed -e '1,/^@ABCDEFG/d' -e '/^include/,$d' $file > x.uue
# some files don't have "@ABCD..." so find a line starting with "begin"
# and print it. then delete from start to (and including) that line
sed -e '/^begin/p' -e '1,/^begin/d' -e '/^include/,$d' $file > x.uue
shift
foreach file ($*)
echo "doing file $file ..."
sed -e '1,/^begin/d' -e '/^include/,$d' $file >> x.uue
end
else
# sed -e '1,/^@ABCDEFG/d' $file > x.uue
sed -e '/^begin/p' -e '1,/^begin/d' $file > x.uue
endif
unset file
echo "doing uude x.uue..."
uude x.uue
echo "done."
/bin/rm -i x.uue
exit
```

>I'm about to start work on an MeSsy-DOS filing system for MiNT, and would
>appreciate some advice about the way it should handle filenames.

Before you "start work" please check to see if TOS's and MiNT's own filesystem isn't what you need. They *are* MSDOS compatible. You can take TOS disks and use them on PC's.

Well, that's not quite true. They have to be formatted by a program which does an MS-DOS compatible format. The difference is a couple of bytes at the beginning of the boot sector. Original TOS didn't set that up the way MSDOS needed. New TOSes (1.4 and greater) do. Other people's formatters, like DoubleClick, let you select this as an option. There is no difference at all in the data part of the disk, only a couple of bytes in the first sector which we ignore and they use.

Sometimes you can format a disk on a PC and use it on an ST. You can certainly READ the disk on the ST. You can't WRITE it unless the disk was formatted with two FATs. Some newer MSDOSes think they're doing you a favor by writing just one FAT. If you have one of those, use the option to FORMAT which says, "Put two FATs on the disk."

Aside from these details of formatting (which are not minor), the TOS and MSDOS filesystems are identical, files, subdirectories, and all.

>It is true, other than real cheapo's, the defective floppy disk can be
>returned to the dealer. (Do you all save all your receipts? :-)

I don't know what you mean by 'real cheapo's.' :^) I guess you could
say I buy the real cheapos from MEI Micro. But when I get a disk with
a bad sector, which is rare, I just call them up and they send me a new
one, free. Their disks are 39cents each in lots of 25. It costs me
around $20 for 50. Their number is 800-634-3478. Ask them to send you
a catalog. I've been buying my disks from them for years.

>Still, which formatters on the Atari do at least verify the formatted
>disk? Especially, MS-DOS compatible formatters; you get 4 extra
>sectors for free!

DC Format 3.02 does verify and marks the bad sectors.

I am having a dificult time finding someone who has installed
an OVERSCAN switch on a 1040STf. I know it can be done, and
I'm looking for specifics.

My ST' motherboard has its ram located under the Motherboard,
and Its modle number is ST PCB.P.N.C070789 REV.XXX

PLEASE!! Help!!

I have installed a multiSync monitor and I want to try and
max out the resolution to see how it looks.

Any information is greatly appriciated.

Try getting a V- Killer program I that should work the best....

I think that they are up to version 3.5
you could probably get the program off any bbs in your area or go to a
store and look in the public domain section of ST software

Hope this helps

>I didnt find a solution (maybe patching gcc.ttp could help). Try to get
>hold of a newer gcc version (I have one that works).

The problem is the GCCEXEC variable being set or not set at all. RTFR
that came with the program to learn how to set the var correctly.

Example (for GULAM):
setenv GCCEXEC d:/gccbin/gcc-

The error message is misleading (read: wrong) and the problem has
nothing to do with the temp file.

Source record: 232158

Well, the gist of my mail seems to be that most people would be interested
in :

1. Creating a new newsgroup to post things like the new uploads list
or
2. Posting it to comp.binaries.atari.st

Problems I forsee with this:
1. People who receive c.s.a.st in digest form completely miss out
on good info.....
2. Why bother Steve Grimm?
3. There would hardly be enough traffic in a new group to warrant
it's existence
4. I don't feel like getting a new group created :)

Comments, ideas, etc. here or to me please....

>All pointers towards a solution are welcome.

Yeah, you can just erase the boot sector and that should solve your problem.
Be sure to reboot then, with a clean disk.

Or you can pick up a copy of George Woodside's Virus Killer at atari.archive.
The latest version is 3.84. The filename is vkill384.lzh, I think.

NCOYNE@ESOC.BITNET writes:
> Listen I ve got the dreaded mouse pointer reversal virus. I need to
> stamp out this beasty.

Okay:

(1) Re-Boot your system with no disk in the disk drive.
(2) When you get to GEM, format a disk. Use this to boot from now
on.
(3) Call a BBS, or download from atari.archives, a Virus Killer.
Use the program on all of your disks.

When you have cleaned all of your disks using a Virus Killer, then you
will not need to use the boot disk from step to. You can go back to
doing things the way you did before the Virus. Also, if you find out how
you got the Virus, please let us know.

Note: The Atari Virus Killer 4.00GB detects Link Virus programs, which
are Virus' that get executed when you run certain files you download.
So, try to get the Atari Virus Killer.

The directory structure is really clear in the `CompInd.Z' file. I also think
that the missing of the binaries/sources entries makes the index file more
accessible for those who can access atari.archive only by e-mail.

==========((=====(((((((==((((((==((((((=======((==========
========((==========((====((=((((==((==========((==========
=======((((((((((==========((==(((==((((((((=====((==========

Z*NET INTERNATIONAL ATARI NEWS SERVICE - Z*BREAK #91-20 - 5/15/91

START MAGAZINE CEASES PUBLICATION
Story by John Nagy

After days of conflicting rumors, it was confirmed by START Magazine
staff members today that the bi-monthly Atari magazine START will NOT
publish another issue until further notice.

"STart has suspended publication pending a sale of the magazine," said
Editor in Chief Tom Byron. A sale is said to be in the works with
unidentified parties, and no timetable is being discussed publicly.

Byron also said that the next issue, the June/July edition, is complete
and was waiting for printing when he got the news today that the
suspension was in effect.

The resolution of the fates of subscribers and the many writers to whom
STart has owed moneys dating back to mid 1990 is not known or
predictable at this point. If STart is sold, it may be that those owed
will be paid from the revenues, or the new owner may assume the
liabilities of the company. A third possibility is that there would be
a liquidation and sale of assets held by STart itself, which may be
negligible.

Z*Net will continue to follow this story which is of great concern to
the entire Atari community. STart is the last commercial "slick"
magazine for the Atari in the U.S.A. It will leave behind only Atari
Explorer, Atari's owned house magazine, and newspaper-type publications
like AtariUser and ST INFORMER.

Look for followup on the STart story in Z*NET #91-21, this weekend on
telecommunication services and bulletin boards world-wide.

Sorry, I do not understand this shell script. Don't all versions of
Dumas' uud strip extraneous headers and trailers from uuencoded files?
The problem arises with all the nonstandard decoders/encoders that
exist.

I use GNUS for reading, and I call uud directly from the Article
buffer in the case that the encoding is complete. Otherwise, if the
article is recognized as a `uud' part, then the proper named part file
is automatically saved.

Cheers,

You're not the Lone Ranger!

STart is dead! The magazine is not being published any more.

Antic software is in (and I quote) "Survival mode" and is selling all their
ST software at outrageous prices, and even trying to cut special deals with
distributors.

They have not paid us for two (2!) years for the sales of Shadow!!!

*** As a side note, we have terminated the contract with Antic and now have
*** regained complete control of Shadow. WE ARE UPGRADING SHADOW NOW!!!
*** Stay tuned for more details about Shadow 2.0! We heard and are doing!

They say they have "every intention of paying everyone we owe money to."
Sure, sure... We hope so.

As an editorial aside...

It is truly sad to see this happen. I remember buying Antic #1 when I had
my 8-bit. I 'grew up' with Antic, watched them grow and become a major
selling point for Atari. They were the last cornerstone in the US market.
(OK, so ICD now is the last cornerstone - at least they are doing ok).

If anyone wants to keep tabs or follow the creative forces that were once
Antic software, then buy AutoDesk software. Many of the Atari greats from

Antic work there (Tom Hudson, Jim Kent, Gary Yost, etc...)

I believe the problem is a memory leak somewhere. GNU Make seems to
crash after I use it for a while, and the more memory I have
available, the longer it takes. I haven't really tested this idea out
scientifically, so it should be taken for what it is--pure
speculation. In reality, the problem might be caused by something
completely different.

>something that will take all the mailed/posted part and make one .uue file I
>can send to our VAX for uudecoding (the uudecode on the SUN tends not to work).

You can use a simple sed command to do just what you want:

```
cat myfile.u?? | sed /^include/,/^begin/d > myfile.myuue
```

Cat will get the files in alphabetic order, sed strips all the
lines between "include myfile..." and "begin part..." (inclusively).
The resulting file will still contain the lines before the first
"begin..." but uudecode doesn't bother with that.
(Be sure to name the resulting file so it doesn't get an argument
to cat, too :-)
You can set yourself an alias for the command sequence above or
make it a shell script.

Greetings,
Wolfgang

Message-ID: <q7R221w164w@midiline>
Source record: 232169

I knew it! I knew it! STart is going down, just as I sensed might happen. Seems interesting that ST-Log and Analog started this trend of "switch to lower distribution ratios, then shut down after the next issue." Actually, I can't say I'll miss STart. The magazine is nothing short of boring except for the few bits of news in it. The programs are next to worthless, and overall, the only magazine I thought was the ultimate of ultimates, was Compute!'s Atari ST disk & Magazine.

I don't meant to rip asunder, but I felt the urge to comment on this issue. The only thing I'll really miss about STart, is that I won't be able to thumb through it every month before putting it back on the shelf and leaving the bookstore.

Now, if you want QUALITY material, I recommend Atari Explorer (even if it IS owned and run by Atari, so we'll probably never get truely OBJECTIVE reports on anything except Atari parts and peripherals), AtariUser, ST Informer, and perhaps another that may exist out there... Ciao!

Source record: 232191

I've been playing Blood Money on my Mega ST, and would like to
recommend that my friend (who owns a 1040STE) pick up a copy.
Has anyone run this game on an STE?

More generally, has anyone seen a recently published list
of older software that is compatible with the newer STE's and
TT's? If there is no definitive list, I'll volunteer to
compile one if folks will e-mail me their experiences.

Don't forget that Dave was probably using a developer's version which
still has lots of debugging code in it which makes it much slower than
the release version (oy, you should have seen early versions of HC2,
boy were slow!)
From experience, it runs as fast as 6.07 and doesn't crash as much.
It certainly has a much nicer interface. How fast it runs on a Plus/Classic
I just don't know. Anyway, I'm sure that Mr. Small will get it running
on Spectre sooner or later.
On the subject of getting virtual memory to work under system 7, I think
some of the '030 boards for the SE and Plus will give the machine virtual
capabilities under system 7 and since they are using the same roms(or
similar as in the SE's case) that might bode well for '030 equipped ST's.

Oh, I got my Spectre 3.0 upgrade several months ago.

|I don't think you should be rail roaded in what Atari gives you, I
|believe in freedom of choice, and not this dogmatic attitude that Atari
|gives you.

Precisely. You are free to use whatever hard disk driver software
you desire. If you want to use the Supra software, buy a Supra drive
and use it. If you want to use the ICD software, buy an ICD drive
or host adapter, and enjoy yourself.

Likewise, Atari should be free to choose whether or not to follow
a "standard" created by a third party. Some such standards are hacks,
some are good ideas, some have a core of good ideas with a lot of
extra nonsense that Atari doesn't need in a standard.

The bottom line for us is that it doesn't matter what standard we
decide on, some people will be unhappy with our decisions. That's
something we live with. You can't please all the people all the time.
You can't please all Atari users hardly ever <grin>.

This is not the case. TOS can't deal with filenames containing slashes.
What CAN deal with them is programs compiled with Bammi's GCC libraries (or
the MiNT libraries, which is almost the same thing).

This guy's problem is that drive D: doesn't contain a directory called tmp
in its root.

Z*NET INTERNATIONAL ATARI NEWS SERVICE - Z*BREAK #91-20 - 5/15/91

START MAGAZINE CEASES PUBLICATION
Story by John Nagy

After days of conflicting rumors, it was confirmed by START Magazine
staff members today that the bi-monthly Atari magazine START will NOT
publish another issue until further notice.

"STart has suspended publication pending a sale of the magazine," said
Editor in Chief Tom Byron. A sale is said to be in the works with
unidentified parties, and no timetable is being discussed publicly.

Byron also said that the next issue, the June/July edition, is complete
and was waiting for printing when he got the news today that the
suspension was in effect.

The resolution of the fates of subscribers and the many writers to whom
STart has owed moneys dating back to mid 1990 is not known or
predictable at this point. If STart is sold, it may be that those owed
will be paid from the revenues, or the new owner may assume the
liabilities of the company. A third possibility is that there would be
a liquidation and sale of assets held by STart itself, which may be
negligible.

Z*Net will continue to follow this story which is of great concern to
the entire Atari community. STart is the last commercial "slick"
magazine for the Atari in the U.S.A. It will leave behind only Atari
Explorer, Atari's owned house magazine, and newspaper-type publications
like AtariUser and ST INFORMER.

Look for followup on the STart story in Z*NET #91-21, this weekend on
telecommunication services and bulletin boards world-wide.

4081. Atari Mortis

Newsgroup: comp.sys.atari.st
Date: 1991-05-16 23:10:05 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <ccAl5B600Uzx83AuIs@andrew.cmu.edu>
Source record: 232185

Ah, STart has gone belly-up. I'm not surprised. The entire Atari market has gone belly-up. It's next to impossible to get *anything* for your Atari (in my experience) without resorting to Atari-specialty stores and mail order (and even they are drying up.) People are deserting Atari left and right: dealers, users, and certainly developers. Software is slowing to a trickle. I hope to god I can sell my 1040ST, monitor, printer, and tons of software for even a third of what I paid for it all. Atari can't come out with a new product that will sell (or even pass FCC approval, it seems.) There is no way in hell I would buy a TT, even if it wasn't ridiculously overpriced. Atari may not go bankrupt, but it'll take a miracle for it to get back anything like the market share it once had.

I remember the golden years. I was twelve years old when I got my 48K Atari 800 and tape drive. I was seventeen when I got my 1040ST. Now I'm a starving college student with barely enough money to get a Mac LC if I work my butt off all summer. I'm not trying to start a flame war here, but Atari is on its last legs. No one I know wants anything to do with them or their products. God, this sucks. I was brand loyal and didn't buy an Amiga. I hate IBMs, and Macs still cost a lot. Atari used to have good products at great prices. No more.

I'm sorry for the rant and rave. Maybe it's all the Tramiels' fault. Maybe it's a natural economic cycle. Or maybe I've outgrown unreliable companies like Atari. Apple Computer, here I come. *Sigh.*

I have one original Atari SF314 DS disk drive for sale. P/S and Cable included.

This is one of the original good drives with an Epson mechanism. I no longer need a second drive, since I got a 4 Mb STE.

I'd like $100 for it, including UPS shipping, but I'd consider other offers.

For comparison, this drive (if they still made them this well) would cost $199 new from Atari, and has a new street price of around $160.

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 01:30:21 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991May17.013021.1415@terminator.cc.umich.edu>
Source record: 232189

Well, based on the mail I've received in the past two days, most people
(read everyone who sent mail) thinks it's a good idea for these
files to be posted.

A few concerns were brought up (I mentioned them the other day).
The first was putting it in a new newsgroup. If someone wants to
start a comp.sys.atari.pd newsgroup or something like that, go for it.
However, as a service to the people who are reading this in digest form,
(who have spoken quite loudly), it'll be auto posted here every
week. It's usually only 1-2K, unless Todd or Ed or Jim or .... have
a lot of spare time. :)

Hope it's beneficial to everyone.

Greetings.

I would like to get an apple 2 emulator for my pc. I don't care if it's software or hardware. I have taken a look at the one on simtel and about gagged. It's a nice program if all you're going to do is run applesoft basic stuff.

So here's the criteria.
1: has 128K free to the "apple"
2: is apple][e or bettor.
3: displays color.
3: will go into 80 column mode (pr#3).
4: will READ and WRITE apple dos 3.3 (16 sector) files with an ibm drive.
5: will run copy protected stuff (my collection of Ultimas)

the list looks about right off the top of my head. Any info is greatly appreciated, wanted and/or needed (I want to get rid of the old][e and recover some desk space).

4090. update soft/hardware for sale

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 02:26:27 UTC
From: hong@tove.cs.umd.edu
Message-ID: <34580@mimsy.umd.edu>
Source record: 232180

Hi, here is the list of what's left for sale:

Hardware:

SF 314 disk drive.................$95
Mouse Master.....................$13
2 Wico command control joystick...$5 each

$10 a piece
Hit Disks Volume 1, Music Studio '88, Gauntlet II, Wordup 2.0,
Hot Wire (by CodeHead, it's a utility), Indy Graphic Adventure,
Computer Hits II (4 games), Art and Film Director.

$7 a piece:
Bard's Tale, Forgotten world (the metal door on one disk is missing, but
it boots fine), Atari Planetarium, Street Fighter, Shanghai.

$5 a Piece:
Flash(communication), Borrowed Time, Super Star Ice Hockey,
Gone Fishing, , Knight Orc, Phantasie III.

$3 a piece:
Boulder Dash Construction Kit, Time Bandit, International Soccer,
Red Alert, death Sword.

Order more than 3 pieces,I will pick up shipping, otherwise $1.50 per order.

Please send reply to hong@tove.umd.edu

>trouble of selling their software.

As I've noted before at time, it seems to me that *most*
shareware authors aren't thinking much about what they are doing
at all, let alone how it affects the commercial market. I've
found that in a large number of cases people put on restrictions,
Copyright notices, money begs, and such just because they see
other people doing it. You wouldn't believe how many times
I asked people why they put a Copyright notice on something and
the answer was something like "isn't that what you're supposed
to do?" When I asked what they meant by "supposed to," I got
the equivalent of a blank stare.

>> What's interesting is that there are so many people who are
>>"new" to the Net that this whole argument seems to be new to a lot
>>of people. This is one of the oldest historical arguments on the Net.
>>It may surprise many here, but there has *always* been a disagreement

>
>FTP is very different from "the Net" -- do you have the same feelings
>about things "posted" via FTP?

Well, teh question is, having read my reasons, and added your
own, and those of other people, what do *you* feel about it? I'm
getting the impression that you think that I had very heavy feelings

about the matter. If you still have my original message lying around
I think you'll find it interesting to read it again. I never said
that this was an all-consuming-passionate-belief-in-the-core-of-my-soul.
But since you ask, I'll lay out the 2 points and apply them:

1. As far as objections to Shareware based on its distribution
on the Internet is concerned, no, of course direct FTP doesn't
violate the principles of Nettiquette. That's always been clear,
and I specifically noted that in the case of CIS, it had nothing
to do with it being commercial. You're simply not using the Net
when you call a site directly. I can't make that point any clearer.

2. Shareware still does add to the problem of causing confusion
to end users and of course BBS operators and just about everybody
else who comes into contact with them. That confusion hurts in
a couple of way. One way is that it makes people stop caring
about the differences between all the different variations and
they find it easier to violate notices -- easier for them to
ignore their consciences and become pirates. Also it makes it
easier to violate Copyrights even when people are still being
consciencious because they sometimes don't understand or don't
remember that a specific restriction was on a particular piece
of software.

Whew. Umm. In all this discussion on those points, nobody
has mentioned any of the current magazines for the ST in North
America. Aside from Explorer, and the "fanzine" thingy (I can't
remember the name -- it's the one that's just a bunch of reprints
of club newsletters), are there any others?

Hm. Actually I set it up to run every night, but we can step back to once a week easily enough. Just have to watch how much useful traffic is generated, and balance against the size of overhead (e.g. article headers.)

4093. RZ/SZ Questions: Sending Xmodem/Ymodem/Ymodem Batch

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 06:48:47 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <1Rw321w164w@ersys.edmonton.ab.ca>
Source record: 232197

I have a few questions concerning Zmodem (SZ):

1. How do you force SZ to send a file as Xmodem/Ymodem/Ymodem Batch? I tried renaming the file to SX and then passing the filename to be sent as the only parameter. This didn't work.

2. Is there a way to force Xmodem and Ymodem transfers to use 16-Bit CRC error checking instead of 32-Bit CRC error checking. For a Zmodem transfer, you can pass "-o" to accomplish this, but I haven't had any luck with Xmodem/Ymodem/Ymodem Batch.

If anyone can help me out, I would greatly appreciate it. Zmodem is a great protocol, but it isn't the easiest thing to work with. If anyone could point me to the documentation for RZ/SZ, that would also be appreciated.

4094. Complete Macintosh emulators for Atari ST forsale.

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 06:57:28 UTC
From: stevela@beach.csulb.edu
Message-ID: <1991May17.065728.23135@beach.csulb.edu>
Source record: 232196
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I have two Macintosh emulators (complete package) for sale:

1. Spectre 128
- Genuine Apple Macintosh 128K ROMs
- Spectre 128 Manual
- Spectre software version 2.65
- Transverter Manual
- Transverter software version 4.21
- and some other system disks in Spectre format to get you started

2. MagicSac+ and Translator-One device
- Genuine Apple Macintosh 64K ROMs
- Built-in clock chip on the cart
- MagicSac+ manual
- MagicSac+ software
- Translator-One device (allows ST drive to read Mac disks directly)
- Translator-One manual, all necessary cables
- and some other system disks in MagicSac format to get you started

I will also throw in Microsoft Word (complete) with both Spectre/MagicSac
format and Macintosh format disks.

I am asking $275 (including shipping) or best offer for the whole package.
send me email if you are interested.

4095. Hard-Copy with 24 pin printers

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 07:47:18 UTC
From: hohr@cernvax.cern.ch
Message-ID: <5303@cernvax.cern.ch>
Source record: 232194

Hi Atarians,

At atari.archive, in printing/ you will find the following programm:
(thanks Jeff!)

HC24_V13.PRG

This utility replaces the internal hard-copy routine (for 9 pin printers)
by an other one for LQ500 compatible 24 pin printers (high resolution only).
At least, it works on my Brother M-1224L...

In addition, it respects the x/y ratio (circles on the screen are also
circles on the paper) and needs only 1.5Kb.

Put it in your \AUTO\ folder. If you have also SPOOL.PRG there, it takes
nearly 7.5 seconds on a Mega ST1 and nearly 3 seconds on a Mega STE until
you get the control back.

Use it at your own risk: it's absolutely free. If modified, please let me
know. Not to be sold or for commercial use. I just hope it works for you too.

Enjoy!

Roger Hoh email: hohr@cernvax.cern.ch

4096. Re: Wordflair II note

Source record: 232001

Mickey:

Hmm, that is strange, WF II works great on 2mb TT. The "Print..." menu being grayd out means something went wrong during initialization of the printer driver. Besides the obvious (printer not turned on, driver not found etc.) this could mean that he has memory eating DA's or PRG's in the AUTO folder.

As others have recommended, ask your friend to remove the larger font sizes from his ASSIGN.SYS. Especially with the laser printer, sizes over 18 point get really BIG.

If this all does not help have him call our Tech-Support at (415) 243-9605 and ask for Craig. He is our local ASSIGN.SYSpert.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available. Finally, there is the Lynx (a game machine) and the Atari
ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources
```

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
you don't know how to eliminate other newsgroups from a reply to an article
which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local
distribution of comp.sys.atari.st. Those outside the United States have
little desire to read about that neat bit of [hard/soft]ware you're selling
when you live in the U.S.A. If you don't know how to restrict distribution of
a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this
article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

For Mail Service:

atari-server@twitterpater.Eng.Sun.COM:

(Panarthea has been moved to a new system called Twitterpatter.)

Twitterpatter holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to atari-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

Bart help may be attained by mailing atari@atari.archive.umich.edu and
enclosing the word 'help' in the body of the message. If
you are from a uucp site, please enclose this statement also

'path host1!host2!....', where host1!host2!... is your path.
Please read the help file completely before you ask questions,
and then send any you may have to jon@atari.archive.umich.edu. Jeff
Weiner will only forward them to Jon, so please save him the time.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only
via JANET. Mail access is available from within the UK - send mail to
archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

NOTE: The server has moved from unido.informatik.uni-dortmund.de. FTP
requests to the old address direct you to the address given above. I do
not know the current status of the old mailserver, but would appreciate
learning if it still exists.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU
programs ported to the ST (including ports of emacs and bash and an extended
version of bammis library for gcc) and also ports of software posted to
comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

BITNET users:

LISTSERV@UOGUELPH.BITNET

Mail messages with the contents HELP will bring you some usage information
and GET INDEX PROG-A16 will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features

and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST. The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him at klute@irb.informatik.uni-dortmund.de or klute@unido.uucp, or klute@unido.bitnet

arcshl23.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35
```

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordUp!, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor
BASH GNU Bourne Again Shell - available under MINT
ksh Korn Shell - available under MINT
gemini MUPFEL is the shell used by the gemini environment
okami a German shell with many useful utilities built in
pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.0) has recently been made available on the atari.archive server. The files may be distinguished from the other TeX/LaTeX files in the /atari/tex directory by their date (posted in December 1990) and by the fact that they are all archived using LHArc (.LZH suffix).

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the minimum files needed to get a working TeX/LaTeX system up and running on the Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

LANG
Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc
apl Demo and 'J' j_29.arc,apl68000.arc
forth Don't know which, I prefer BRADLEY FORTH
FORTRAN77 BC-FORTRAN version 'C' bcf.lzh
icon ICON icon2.arc,icon_bin.arc
modula-2 From Germany modula2.zoo
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254] and most of the other European FTP sites.

How do I set it up once I get it?
==========

I just spent a bit of time putting the gcc compiler on my hard drive. I tested it using the good old reliable 'hello.c' program. Here are the

notes I made with regard to installation:

The following files were FTP'd from the atari.archive server:

/atari/gnustuff/tos/gcc139b.lzh

(current file [as of 7 May 91] on atari.archive has a corrupt GCC-CC1.TTP)

/atari/gnustuff/cc1-139.zoo

(good copy of GCC-CC1.TTP)

/atari/mint/mntolb8.zoo
/atari/mint/mntinc8.zoo

(you -might- want to use it with MINT, so why not?)

1. Extract all files EXCEPT 'gcc-cc1.ttp' from GCC139B.LZH (the file is corrupted in the current version on atari.archive). Place the files in \EXEC and set the environmental variable GCCEXEC to point to the directory.

2. Extract 'gcc-cc1.ttp' from CC1-139.ZOO and place the file into \EXEC.

3. Extract all files from MNTOLB8.ZOO. Place the files in \LIB and set the environmental variable GNULIB to point to the directory.

4. Extract all files from MNTINC8.ZOO (including subdirectories!). Place the files in \INCLUDE and set the environmental variable GNUINC to point to the directory.

Add the following aliases to your CLI's autoexec file. The following lines come from a slightly modified 'gnu.g' which came with my release of the Gulam shell. Check your CLI docs for differences in how environmental variables, etc. are set!

gnu.g
```
----- cut here ------
unalias cc
unsetenv TEMP
#
# set up commands for gcc and gas
#
alias cpp d:\exec\gcc-cpp
setenv cpp d:\exec\gcc-cpp.ttp
alias cc1 d:\exec\gcc-cc1

------ cut here --------

OTHER FILES YOU MIGHT WANT/NEED:

FLEX.ZOO - lexical analyzer
BISON.ZOO -
DOCUMENTATION.ZOO - some nice-to-have documents in TeX format
DIFF115.LZH - can handle binary files as well as ASCII files
RCS5AP1B.LZH and RCS5AP1M.LZH - Revision Control System
GULAM.ARC - one of many CLIs which will work with gcc

Like I said, I successfully compiled a program using the above procedure
(and I didn't have bison or flex or the documentation or RCS or diff...) so
```

it is the minimum you need to do to get going.

If anyone has corrections, additions, suggestions about these directions, please send me e-mail so I can incorporate them into the next 'welcome to comp.sys.atari.st' ... I'll be working on minimal TeX / LaTeX instructions next.

FREE
What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it
via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu"
or by calling (216) 368-3888 300/1200/2400 bps. Once on the system,
a user can apply for an account application and logon as a visitor.
Once here, simply type "Go Atari" to get to the Atari SIG. A visitor
can go anywhere on the Freenet and can read anything. They can't
post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

MINIX
Is MINIX available on the Atari ST?
==================================

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386,
and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and
later in 1991, Sun SPARC. It is available with all the source code for
the entire operating system, the libraries, and nearly 200 UNIX-like
utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free
via anonymous FTP for people on the Internet. A Macintosh version will be
online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to
ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME
file describes the contents of the directory and how to use it. Be sure to
fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-
Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T
ask me to send it by email. I have quite enough work already thank you.
The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you desire.

Atari has gone to a 2-tier developer membership. The 'higher quality' developer support goes to commercial developers, and costs $250. The 'no-hand-holding, no announcement of company future products, no access to discounted hardware' goes to noncommercial developers, at an initial cost of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also
available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
================

Simon Chappell is compiling a list of people interested in exchanging
paper-based mail "of interested parties who could then
keep in touch and prevent themselves losing touch with the ST community
at large (this would be especially easy if someone who still had net
access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

MAGS
What magazines are available for the Atari ST?
==

The information here is preliminary. If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.
As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class (there is
currently a $15.00 introductory subscription available for a limited time).

Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

UK Mags:

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

There are ST sections in New Computer Express (weekly), Computer Shopper (monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13, GERMANY

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

4101. Re: GNU Make troubles: 2 bombs!

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 11:04:13 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91May17120413@ghiggins.hpl.hp.com>
Source record: 232003
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

```
++ I believe the problem is a memory leak somewhere. GNU Make seems to
++ crash after I use it for a while, and the more memory I have
++ available, the longer it takes. I haven't really tested this idea out
++ scientifically, so it should be taken for what it is--pure
++ speculation. In reality, the problem might be caused by something
++ completely different.

I *wondered* whether that was the problem I was getting, I checked ou the
operation of GNUMake under Monitor and the problem seemed to be some
interaction between the CLI (Edgar Roeder's Bash) and Gnumake and seemed to
indicate problems with mshrink.

I recompiled GNUMake for my own purposes, without a number of the
search options (.F, etc) and removed the SCCS stuff, leaving in the RCS. I also
used a different shell. The problem went away. I didn't follow it up.

4102. Re: Atari Mortis

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 12:19:43 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1991May17.121943.1@simvax.labmed.umn.edu>
Source record: 232007

In article <ccAl5B600Uzx83AuIs@andrew.cmu.edu>, mg20+@andrew.cmu.edu (Michael Paul Greelish) writes:

A lot of 'doom-and-gloom', 'woe-is-me' stuff, which I don't actually believe.

Let me tell you a few stories ...

1. I visited the Atari dealer in the Twin Cities area two days ago. They had an Atari TT on display (which I -hope- they can hold onto long enough to show off at tonight's user-group meeting). They received their first TT's a month or two ago, and each time they get a couple of new machines, they're sold within days. Same thing with the Mega STe and the regular STe machines. And these sales are not generally to people who already own an ST. The selling points? Calamus, DynaCADD and a host of other software available.

2. I received a phone call this morning from a magazine writer in Texas who wanted to know how folks are using the Atari ST (can't remember the name of the magazine -- I get calls all of the time from computer survey groups, and just sort of glaze when they say who they are). I spoke for about 30 minutes, telling her for what manner of things people are using Atari computers. In brief: professional recording studios use them to control synths and tape recorders, professional musicians use them on road shows, amateur musicians use them for any number of things -- including playing music at -their- speed and speeding the tempo until the song sounds right; professional publication production, neighborhood newsletter production, brochure production ... and a host of other DTP functions; Computer-Aided Design, low-budget graphic demos (for high-budget graphic production), doodling; word-processing; telecommunications -- including staying at home while working at the office; playing games; programming (the benevolent term for hardware and software 'hacking', before the term 'hacking' got such a disreputable meaning); emulation of computers at work, so that the user can continue to work at home; the list goes on and on ...

3. People shouldn't purchase computers with the idea that they're ever going get ANYTHING near what they paid for it in the first place. A computer is not an investment like gold or art. As the technology advances, as older technology becomes cheaper, computers lose their value - EXCEPT the value they have in "Getting The Job Done". I owned an Apple][+ at one time, sold it for about 1/3 what I paid for it (after 5 years), because the technology hadn't advanced far enough in those 5 years ... I owned an Atari 1040 ST (I have a Mega ST now ... thanks Kent), sold it for about 1/5 of what I paid for it (after 5 years), because the technology had advanced so far in those 5 years that the newer machines could be sold for 1/3 of the cost of my 1040 ST!

The things I use my Mega ST for haven't changed much over the years. I still find that my computer is as useful today as it was a year ago, or two years ago, or three years ago ... no, I find it MORE useful today.

All of this doesn't mean that people like Mike Greelish shouldn't abandon their Atari ST's and go buy Macintosh computers. If they feel so frustrated, they should certainly dump their current machine, hang the cost, and go buy what they think will not frustrate them. I just want to point out that things are NOT as disappointing for other Atari ST owners as Mike appears to believe.

```
PORTABLE ADDICTION Issue #01 May 15 by Tjerk Heymens Visser and Yiri Kohl
The newsletter for the Atary Lynx and the Atari Portfolio
--------------------------------------------------------------------------------

Hi folks,
This is the second issue of Portable Addiction. We've had good reactions, so
we'll carry on with the newsletter. It will come out around the middle of the
month.
We had many requests from people who wanted to know what the computer market
is like in Europe. For that reason we have started a regular column.
This month we have alot of Portfolio news, like reviews on PBasic 3.0, Portboot
and the Portfolio Toolkit.
If you have any questions about the Lynx or Potfolio just send them in and
we'll try to answer them in the letter section.
Here comes...

Tjerk Heymens Visser
Editor.

NEWS AND GOSSIP
---------------

The Portfolio II was not on the CeBit in Hamburg, so it will not be released
in the comming 2 years.

Hewlett Packard has made it's own portfolio, it has already 0.5 meg RAM
built in and it has also Lotus standard (!).
It is as big as the Portfolio and runs on 2 penlites. Detailed info when we
have it.

There is said to be bigger memory cards for the Portfolio to be released
soon, they will be up to 1 MB and they will NOT be extremely expensive, they
might even be cheaper (!!).

Warbirds was released in the USA on 10 May, we've heared that it is a very
good game. It has been designed by Robert Zdybel.
It will take about 2 month untill it reaches Europe, we'll have a review
in issue 03.

Blockout is probably the next game for the Lynx to come out.

Hole in one and Big Run were to be released in March for the Super Famicom,
Super R-Type and Darius Twin will be released in 1991, we don't know when.

There is a new video games magazine in Europe, it has reviews on games of all
consoles. It is called Video Games (by the makers from Power Play).
```

It is German, it has been available since May and it will be a monthly.

LYNX SOFTWARE RELEASE DATES !!!!

We just got these dates and they have not been confirmed by Atari Holland, and
the March and April games have not been released yet in Europe.

MARCH: Blockout APRIL: Superbowl Football
Warbirds Checkered Flag
Xybots Vindicators

MAI: Tournament Cyberball JUNE: Scrapyard Dog
Worldclass Soccer Turbo Sub
Ninja Gaiden Viking Child
A.P.B. Bill and Ted's excellent adventure
Gridrunner Rolling Thunder
Pinball Jam/Shuffle
720 Degrees
Casino

JULY: Toki AUGUST: Ishido
S.T.U.N. Runner Baseball

OCTOBER:Ice-Hockey
Basket Brawl
Geo Duell

NOVEMBER/DECEMBER: No releases planed yet

Further games to be released in 1991:
Pac Land
Pit Fighter
Hydra
Hard Drivin'
Raiden
Leaderboard
Super Skweek

LYNX review GAUNTLET III

I think that never ever before a games reviewer has been bored so much by having
to test such a dispickable game. OK, so the title screen is nice, and the
graphics are quite well, but even these factors can't save the pathetic attempt
at a game. Nice when you start with it, but it gets SOOOOOOOO boring!!
Rush through 40 mazes filled with gold and monsters without losing all your
lifepoints? Nice concept, but 40 mazes can get SOOOOOOOO dull!!

Graphics: 6_ Quite nice
Sound: 3_ Irritating in-game music
Playability: 3_ Boring
Lastability: 1_ About 1 week
Overall: 3_ **********

LYNX review KLAX

SOUND, VOICES !!!!!
These are the most beautifull voices I've ever heard on any system.
The calls for the waves, the cries when you get a five-in-a-row Klax; It's
like it's live. At first the game play becomes second placed, but when you
get going you'll never want to stop. The graphics are nice, the tiles are
clear and the background is beautifull. You don't need to read the instructions
before you start playing, at the beginning of the first level everything is
explained. You must make rows of 3 tiles(horizonally, vertically and diagonally)
At the beginning of the wave the voice tells you what the wave objective is, if
you make a klax that does not match the objective you'll get the points but
it will not count towards completing the wave. The game does not get dull, even
after 100 waves, that's because of the various wavetypes, like Klax, Points,
Horizontal, Diagonal and Tile Waves. So this is a game that won't disappoint you.

Graphics: 8_ Background is static but stil nice
Sound: 9_ Great voices
Playability: 8_ Simple functions
Lastability: 8_ 100 levels so it'll take a while before you
you'll reach the end.
Overall: 8_ Great, simple, fun. Best falling blocks
game ever.

LYNX review ROAD BLASTERS

I was septic at first, but since I've played it it's heaven (till CHECKERED
FLAG is released that is).
The sound is not KLAX-quallity, but it's still nice.
The play is fast (scaling!!!) and it get's more fun when you catch a special
weapon, like nitro-injectors, cruise-missiles and uzi-cannons. It's a nice game
and it's not only attractive to those who like race games. Personally I
doubt that it is worth the full Dutch price (HLF 90,- = $ 45,-), but because it
is the first driving game on the LYNX , and it will take a while untill
Checkered Flag, Hard Drivin' and S.T.U.N. Runner are released I think that it
will be popular.

Graphics: 8_ Full use of scaling
Sound: 7_ Real radio like
Playability: 8_ Smooth driving, good shooting
Lastability: 6.5_ It's fun but 50 levels of the same
can get boring (but good to watch)
Overall: 7_ First racing game on the LYNX but still
waiting for CF and HD.
COMLYNX -SLIME WORLD

A nice idea of the designer of the game was to change some of the levels.
Level 2 changes from exploration into cooperate, where you have to work
together to find the end(you can't shoot each other but you can clean your
partner with your water pistol).

In level 3 you have to compete with each other, there are no extra slime-shields so the first Todd gets to pick up the shields and gems. There are special icons that make you shoot slime, so you can kill other Todds.
Level 5 becomes a COMBAT level, this level is totally different from the single player mode. There are not much aliens in this level but there are lots of mega bombs and slime icons, the goal is to blow up other Todds as many times as you can. We only tested in two-player mode(we couldn't find more people with Lynxes)and each player has 5 lives, but maybe in more-player-mode each player has more lives(we don't know). When you ComLynx Slime World this is the most recommended level.

SCREEN SCENE EUROPE

This month Screen Scene is a report of our visit to Germany.
Till one year and a half ago Germany was still devided in east and west. Then the wall came down and suddenly western things flooded the eastern part of Germany. We have visited east and west, and compared.
Western Berlin has lots of light-adds on the street(The whole city is like a Cyberpunk story!!). Eastern Berlin however has always been isolated, there were only 2 types of cars and computers were totally out of the question (though we met someone who made one himself!).
When "The Wall" came down western companies came to the east and started to make big money there. For that reason you'll find the Lynx in every shop in the eastern part of the city. But we didn't see a Lynx in the west (which has ofcourse more shopping districts), even in "Das Kaufhaus Des Westens", the biggest mall in Germany, there was no Lynx!! Argh!!!
Games cost DM 80,-, which is about $45,-.

Next month we'll have a full story on how Nintendo failed in Europe, and why Sega has been so succesfull. Plus information on PC Engine, Gameboy, and the normal computers.

PORTFOLIO DEPARTMENT:

Portfolio Toolkit v2.0

This "Toolkit" contains a number of utilities for the Portfolio. Personally I didn't find them all very usefull, but there certainly is something for everybody.
The utility that comes in most handy is the new DIR command, to make the directory more easy to read. It's a real good replacement for the old DIR command, as this wasn't very hot to say the least.

There's also PORTBOOT. This command needs no parameters. It just pops a reboot menu which let's you do a warm reset, cold reset or no reset at all. This can come in very handy.

A nice little utility is PORTTONE, a tone generator. You can even program the notes into a file and then replay it later! WARNING: Sound drains the batteries.
The other utilities can be nice if you have any use fore them. Just check the package out, it's freeware. You might have to search a little while before you

find it, and the only thing we can say is that the package is made by Centennial Software Systems. If you really can't get it anywhere just send us a diskette envelope with enough stamps included for the postage back and your address to:

Yiri Kohl
Liendenhof 113
1108 HE Amsterdam Z.O.
The Netherlands

PORTRIS

This is a nice little Tetris for the Portfolio. The Portfolio is held vertical (Hey! It allmost seems like a Lynx!)and the falling blocks are controlled by the keyboard. This is not the most sophisticated Tetris version, but if you are a true addict you'll probably like it.
Again if you can't find it anywhere, you can allways order from Yiri Kohl.

PBASIC 3.0

This basic for our alltime favourite palmtop was also programmed by our good ol' BJ Gleason (This guy must be programming all day! I like him!).
It works with the build-in editor to save memory, and supports all mayor basic commands. Version 3.0 has full string handling, except for the Inkey$ command. PBasic is more or less QuickBasic compatible, which makes it possible to program while on the run! Yeah! There are also a lot of Portfolio-only commands. you can easily draw an error window, or check the revision number, get the current cursor position, switch between display modes ect...ect...

Conclusion: I think that every self respecting Portfolio owning basic programmer should have this tool in his Portfolio. It takes around 30K, so that isn't much either.

If you want to download PBasic 3.0 you must have PKUnzip or something like that. You can find the PBas1.zip on CIS and GEnie, but I think it is already spread all over the world.

~~~~~~~~ADVERT~~~~~~

LETTERS!!

James Hague:
>For example, you gave RoboSquash a 5 but the note next to the number says it's
>"pathetic." Please don't write weenie reviews by always trying to come up
>with something positive.
And:
>If something really stinks, please say so.
Reaction: A game can be pathetic but it can be saved by it's music or graphics.
Maybe you're happy with the Gauntlet III review.
>Why a newsletter about both the Lynx and Portfolio? They have ABSOLUTELY
>nothing in common except that they are portable and produced by Atari. SO WHAT!
>One is a "real" computer and one is a game machine; there is no overlap
>between the two user bases.
Reaction: You're right but it can be interesting to read something about the
Portfolio even if you don't have one. BTW have you seen PTetris??

Corey Liu:
>Nice job guy's! The more I hear about the Lynx, the harder it is to resist
>the temptation to get one!
Reaction:Just what we need, more Lynx fanatics!!!

Na Choon Piaw:
>Looks interesting, but the tips section doesn't seem to cover anything
>not covered already in rec.games.video
Reaction: You're right but we live in Holland(do you know where that is?)
and all the news(like magazines and new games)arrives later here.

Thanks to everybody who replied to us about the newsletter, we are sorry we
can't answer each of you personally or react to your comments in the newsletter
because we had lots of reactions even from Cyber Labs!!).

Special thanks to: Andre "ALU" Luyer
And everybody who have spread our newsletter on the various
BBS'

Here follows a questionaire because we would like to know how our readers like
the newsletter.

1) Which systems do you own?
PC
Atari ST/TT
Amiga 500/2000/3000
Portfolio
Lynx
Game Boy
Game Gear
Famicom

2) Do you find PA: boring
mmm
nice
megagreat

3) Do you wish PA to appear: weekly
once in every 2 weeks
monthly

4) Do you want PA to be: longer
shorter
as it is

5)What do you think of PA's reviews?
I wipe my but with them, they stink
too dated
not enough info
good
mega great

4106. Reliable archiver/compressor wanted

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 14:06:22 UTC
From: mathew@mantis.co.uk
Message-ID: <B2g421w164w@mantis.co.uk>
Source record: 232008

Could someone tell me what the latest version numbers are for ARC, LHARC and ZOO for the ST?

I'm having trouble finding a reliable compress/archive program. LHARC is too slow, ZOO falls over with particular files, and ARC seems to be dodgy when extracting.

mathew

4107. Monochrome Monitor - Last Chance ?!

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 14:29:38 UTC
From: marshall@hplsla.HP.COM
Message-ID: <5440166@hplsla.HP.COM>
Source record: 232038

I have an Atari Monochrome monitor sitting here, waiting to be connected to an ST machine. I sold my color system earlier this year but the mono didn't go with it.

If you are at all thinking about buying a monochrome monitor to use now, or are afraid that you may want one in the future but won't be able to find one, here is your chance. It works great (last time I checked) and it only has about 5 hours of use logged onto it.

It is in the original shipping carton and I can therefore UPS it anywhere in the US. Please send your offer (keep it under $1000) directly to me so we don't clutter up the notes-group.

Thanks,

Marshall

4109. Problems using GDOS and harddisk driver

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 15:40:29 UTC
From: s_kraemer@iravcl.ira.uka.de
Message-ID: <1991May17.164029.1@iravcl.ira.uka.de>
Source record: 232005

I've got problems using GDOS (AMCGDOS) with the harddisk driver of my vortex HDplus 20 (hardware: Mega ST 2 with TOS 1.4).

GDOS works if I don't use the harddisk, so I guess the problem is the disk driver.

Does anybody know how to solve this? Or can I use another HD driver without getting into trouble?

Thanks for information!

Oliver Kraemer

4110. Public Domain Desk Accessories

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 16:53:33 UTC
From: SYSPMZT@gecrdvm1.crd.ge.com
Message-ID: <91137.125333SYSPMZT@GECRDVM1.BITNET>
Source record: 232011

Now that I've *finally* upgraded my archaic early Atari 1040 ST to a new 1040 STe, and am in the process of ordering SIMMS to take me up to 4 meg, I thought I'd ask the knowledgeable community here what public domain/shareware desk accessories they'd recommend. I've pretty much ignored the ST software world because I run a dedicated piece of software (Dr. T's KCS) that uses my meg quite easily; it also did not have a menu bar for a long time. Now I'd like to take advantage of the machine and get:

A printing notepad
A calculator
A phone/address application
A command line/utility application
Anything else nifty I've either forgotten or did not realize I should have.

Also, any recommendable AUTO folder items, or anything else I *must* have. My requirements are that the software be publicly available, be smooth to use, and have been written to play by the rules (ie, won't interfere with other software). Niftiness counts. I don't mind paying for and DO pay for good shareware.

If replies are emailed to me directly, I'll assemble them into a 'recommended public domain/shareware profile' and post that to the net.

Thanks for any and all information,

Phil Z

Source record: 232012

In article <1331@zinn.MV.COM> kgg@zinn.MV.COM (Kenn Goutal) writes:
>Can anyone tell me about a company called First Stop Computers
>(or Computing), a store that sells Atari hardware and/or software?
>Do they still exist? Are they online? If so, what's their address(es)?
>Are they reputable?

They used to advertise in ST Informer, but no more. I don't know if they've
gone out of business or what. I'd suggest you look for another place.
Pick an Atari dealer, even if it is long distance, and stick with it,
or pick another. I bought something from First Stop Computers, and it was
fine. I then bought something from a similar mail order place, also
advertised in STI, and almost got screwed. I'm going to think more than twice
now about these places that just seem to do mail order.

You might as well give up on 4 and 5. Apple][and IBM drives use
different modulations on the disk. The hardware is incompatible.

What is this doing in comp.sys.atari.st anyway? What is this doing
in any of the groups listed above? Maybe its time to learn to use
netnews responsibly.

>TT version ?

OS-9 for the ST won't run on the TT because we have a different (32-bit)
version of the kernel for the 68020/30/40. Our German distributor Dr. Keil
is nearly finished with a port to the TT, which includes support for the
serial ports, VMEbus, ACSI port, and SCSI port. You can reach them at
6221-862091.

4115. Patching Neopatch (NeoDesk 3.02 upgrade problem)

Newsgroup: comp.sys.atari.st
Date: 1991-05-17 18:59:01 UTC
From: close@lunch.wpd.sgi.com
Message-ID: <1991May17.185901.15659@fido.wpd.sgi.com>
Source record: 232027

Apparently the upgrade program that makes NeoDesk 3.01 into 3.02 has some problems. My local Atari BBS had a patch for the patch. I've included the text for the problem here and will upload the program (~8K) to the atari archive if no one else does in the next few days:

If you downloaded the original PATCH302.ARC you might have had one of the bad "Printer Queue"s that could not print. This version of the NeoDesk 3.02 .ACC file fixes that problem.

There was a previous version of the NEOQUEUE.ACC that was upload that did not fix the problem entirelly (ok, so we tried to fix it too fast). The file length of that version was 8877 bytes long.

The bad NEOQUEUE.ACC is 8875 bytes long.
The second bad one (uploaded before) was 8877 bytes long.

The good one (included here) is 8879 bytes long.

Be sure ONLY to use this file with version 3.02 of NeoDesk.

This file is Copyright (C) 1991 Gribnif Software and may be freely distributed to those legitimate owners of U.S versions of NeoDesk 3.02 who may have a damaged Printer Queue accesory. All Rights Reserved.

STart deserved to die. Compared to magazines such as Current Notes,
the writing and reviews were awful. The demise of such an entity does
not indicate doom and gloom.

I finally got around to playing with my SuperCharger on my TT, and I figured I would tell people that it works, just in case anyone was wondering. I can only seem to get it to work when I am in ST Medium Res, but at least it does work. It seems to run a bit faster too, but I cannot say for sure...

Now I will have to wait and see about the 286 upgrade which is suppose to be out in June...

|> Atari used to have good products at great prices. No more.
|>
In the past dozen or so years, (yah, I know, it's not really the same company), Atari seems to have had fits of brilliance followed by... nothing.

When the VCS came out, it was a great innovation. A CARTRIDGE based video game, an unlimited number of games in the same machine. The 400/800 was another bold stroke. It had sound and graphics as good as it got in the home computer arena. Then, Atari twiddled it's corporate thumbs and sat on it's Warner-Owned corporate butt and coasted into the Great Video Crash of the early eighties. They relied on their older technology far too long, and it nearly killed them. (The 600XL and 800XL were cheaper versions of the tank-like 400/800. I think the 1200XL had an extra function key. :-(But I still cherish my full-colour spec sheet for the 1450XLD!)

Atari crashed, was bought out, and in an astonishingly short time, had announced the Atari ST. (In 130 and 520 flavours, I think) This time, the computer was positioned differently. The ST was a lean, mean computing machine. (Tm) The other upstart, Amiga, had more bells and whistles, but cost a lot more. IBMs had credibility, but cost a lot more. The 'Jackintosh' had virtually everything the Mac had, and lots more, for much less money. The 'game machine' company was playing in the big leagues again.

Then Atari followed the example of the pre-Tramiel Atari, and did diddly. The Mega ST got an onboard clock, a blitter, and a detached keyboard. Yay.

MacIntosh got bigger and faster. Amiga got faster and lots of third party add-ons. Most importantly, IBMs and clones got MUCH faster, and MUCH cheaper.

As Apple introduced 68020/30 Macs at 16, then 20, then 25Mhz, where was Atari?
As 8088s gave way to 80286s, then 80386s. what were they doing?
When did the 68020 Amiga come out? Where were the competing STs?

Atari was spending it's time and energy building clones and transputers. The flagship machine was allowed to stagnate at 8Mhz and 4MB. Capable, sure. But not very glamourous, or inspirational. Why should a third-party developer work on a machine that the manufacturer doesn't seem to want to support anymore? Why would a neophyte user buy a computer with no real

upgrade path? It's my feeling that even OFFERING a top-of-the-line machine increases a companies ability to sell the LOW-end ones. (As the car companies say: Race on Sunday - Sell on Monday) (But what about the transputer, you ask. Surely that was a high end machine! But how many people have actually SEEN one?)

Now, perhaps, the situation is changing. Atari seems to have dumped the clones, and the lethargy of the past few years. A TOS upgrade eventually made it out the door. They FINALLY produced a 16Mhz ST, and the semi-33Mhz TT. The 1280x960 monochrome looks as good to me today as the 640x400 did in 1985. (Which was fantastic for the time) With Unix on the way, the TT may find itself back in the pack in terms of technology. (Most certainly not ahead of it, unfortunately. Why a stupid 720k drive?) The Lynx is an amazing little beast, too.

It seems to me that PRICE is more of a problem now. At the low end, I can get a 1040STE/mono/no HD (since the price cut) for just a little less than I can get a 286-12/mono/40MB HD clone. (Alternately, the 1040 is about half of what a Mac classic with no HD is.)

At the high end, a 386-33/SVGA/100MB HD clone is considerably less than what Atari wants for a TT with 50MB HD and no monitor. Products like Windows largely hide the brain-deadness of the DOS machines, too. Games are even playable.

Atari may find itself confined to dangerous niche markets, unless it can produce another POWER WITHOUT THE PRICE trump card. It has to offer benefits that outweigh the risks people take buying an offstream machine.

How about a TT040? If NeXt can do it for $5K, Atari should be able to do it for considerably less. Even better, a cheaper TT030. (Which I want)

Some creative marketing would be nice. Bundle in a bunch of first-rate programs, in packages like they've had in Europe for years. Cuts piracy, helps the software companies, and gives the consumer a better deal. Package a Lynx with the MegaSTE and TT. (Isn't the most money made from the software?) Go for the throat. Give'm both barrels.

Atari has at least one more kick at the cat. (Just remember, I won't buy any Atari that doesn't have a cartridge port!)

Geez, what a tirade. Hope nobody minded...

I have a memory upgrade kit for the 520/1040 type box.
All you need is the memory. Takes it to 2.5/4 megs. Small
modifications necessary to install. Takes ZIP style 1meg chips.
This is the board that came out of england last summer as a
at-cost project. I never installed it. Comes with necessary cable,etc.
First $45 plus shipping takes it.

Source record: 232017
Cross-posted to: comp.sys.atari.st,rec.music.synth

I'm spring-cleaning my software closet and would like to sell the
following:

1) Master Tracks Pro sequencer (v2.5) from Passport Designs $100
for Atari ST

This contains everything that the latest version of Master Tracks
for the ST has (v3.?), except for SMPTE support. It has a nice
graphical interface and is very intuitive. It is recommended that
it be run with TOS 1.0, although I ran it OK with TOS 1.4 (you lose
the double click capability with TOS 1.4).

2) Hybrid Arts' CZ-Android $40

This is a nice ed/lib for the CZ101. This version only works with
TOS 1.0.

Contact: Glenn Deardorff
via Email (glennd@athena.arc.nasa.gov)
or (408) 425-0699

I will pay shipping charges.

I tend to agree! I think you hit the nail on the head. But I have a slightly
different view.

I think Atari will survive if they gradually enable their machines to run
MAC software at least more easily, so Dave doesn't have to work so hard :).
The MEGA STE with the LAN ports for AppleTalk sure helps

I can tell everyone right now. They only reason why I bought an atari was:

1) Turbo C 2.0 (I have several personal projects going)
2) Mac Emulation (Which takes care of the serious side of computing)

Thats its. I HATE ST application software, except for Turbo C, probably the
most ingenious piece of software I have seen for the ST.

GEM, God, did anybody preview what kind of REAL DOG MULTI-GEM is? Atari
I HOPE will look elsewhere, you people REALLY don't want this, I would take
a UNIX command line over MULTI GEM! Hopefully atari will be realistic and
go the UNIX/MOTIF route.

GEM is brain dead, it never will amount to anything. I wish I could reclaim
my ROM space IMMEDIATELY.

THANK GOD for Dave Small. I would kiss his hiney if he was here, as I finally
managed to pick up a Spectre GCR.

All praise Gadgets by Small.

Now Dave, I WANT a 68030/040 option for my VME equipped MEGA STE!!!

I also want it less than $1000 please.

Absolutely correct. The only things that have kept my ST ownership from being an expensive mistake are: Atari.archive, c.s.a.st, and Current Notes. The first two are free, the last costs $27 a year. For those interested in CN, the address is:

CN Subscriptions
122 N. Johnson Rd
Sterling, VA 22170
Phone: (703)450-4761

At least get a sample issue. You WILL like it!

I am in no way connected with CN blah blah except as an owner of all their back issues.

>slash's which should be backslash's?!?

Many people have had this problem, including me initially. You must
set the environment variable GCCEXEC to be the path to the binaries
plus the initial part of the names. For example, my cpp is
C:/gnu/bin/gcc-cc1.ttp so my GCCEXEC definition for Gulam is:

setenv GCCEXEC c:/gnu/bin/gcc-

If my cpp were just C:/gnu/bin/cc1.ttp then the definition would be

setenv GCCEXEC c:/gnu/bin/
^ note the ending slash.

For some reason the wrong error message is printed in this instance,
and if you think you've set everything else up correctly, this is the
most likely source of the problem.

This really should be in the faq posting if it isn't already. Could
whoever is maintaining it put a note in about this?

From: Dave_Ninjajr_Flory@cup.portal.com
Message-ID: <42463@cup.portal.com>
Source record: 232036

I'd argue if Sys 7 is faster. It sure isn't faster in switching windows on the IIcx I use at work. It drags after 6.0.7. It _is_ neat in that I hardly ever have to use the mouse. It has keyboard methods for running icons, opening window, etc., etc., as well as help 'baloons' for green green beginners. I'll be working with it as soon as my critical application programs are upgraded (the main pain in swithching to 7 for cuent users of the mac), slower or not, I like it better. On Plus type machines, what the GCR emulates, it is so slow I don't think anyone would want to use it.

4137. Linear Programming for ST?

Newsgroup: comp.sys.atari.st
Date: 1991-05-18 21:02:52 UTC
From: jensend1@yvax.byu.edu
Message-ID: <2317jensend1@yvax.byu.edu>
Source record: 232042

Does anyone know of a program that will solve a linear programming problem using the simplex algorithm? Either PC or ST solutions would be useful. If you have code in C, I could use that, as well. Thanks!

Dave Jensen

4138. Hookup through stereo system?

Newsgroup: comp.sys.atari.st
Date: 1991-05-18 21:33:15 UTC
From: slqn0@cc.usu.edu
Message-ID: <1991May18.153315.47847@cc.usu.edu>
Source record: 232043

Is there a fairly easy way to run the sound from a 1040ST through a stereo system? Can it be done through the MIDI ports? I was just looking a friend's Amiga, and thought how much better Atari sound would be if it could be hooked up in a similar fashion.

Any help would be appreciated.

Hoyt J. Heaton SLQN0@cc.usu.edu

4139. More 510ST questions

Newsgroup: comp.sys.atari.st
Date: 1991-05-18 22:40:57 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <42470@cup.portal.com>
Source record: 232037

Many thanx to all who answered my questions a few days ago about the 510ST.

With all the info I got, I said what the hell, and payed $250 for an 520ST with colour monitor. Now I am looking for 'things' for it, and am hoping someone can help me out here.

First off, I need some real telecom software, something where i can up/download stuff. I am using the VT52 emulator on the Language disk and find I cant transfer stuff.

Some poeple pointed out there is way to add memory yourself, as long as you can handle a soldering iron. Ive been an electronics tech for about 4 years now, and I can hold my own with an iron :-) Can someone give me some more info? From the sounds of it, Ill probably just pull out some 64k RAM chips and replace them with 256k ones... I havent yet pulled apart the machine to verify this (next on the bill for tonight)

Can someone supply me with info on a second floppy? Someone had mailed me info on a company that sells hard drives, but I deleted the mail :-(I am looking at a pin out for the external floppy port, but I dont see a power line, so I guess the external box needs its own power supply. And on floppy disks, bricks on the single sided drive! Any way to get double sided?

And finally, bricks on the keyboard! I am spoiled by the DEC LK201 keyboard (VT320... some people dont consider this a nice keyboard, but I do). Any way to get a new keyboard, one that feels a little more realistic?

Many thanx

Billy D'Augustine

The best way to get stereo out of your ST is to get an STe. They have
RCA jacks in the back for right and left stereo, 8-bit PCM channels.

There's also a product for older STs called Tweety Board. It connects to
the Yamaha chip and splits the 3 voices into three RCA jacks, which you
can connect to your stereo. They include a Y-adapter to combine two of
the three outputs. I've heard that digitized sound is difficult to
understand with the Tweety Board.

4141. Re: Atari Mortis

Newsgroup: comp.sys.atari.st
Date: 1991-05-19 03:54:13 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991May19.035413.14005@chinet.chi.il.us>
Source record: 232044

I just did a bit of comparison shopping. Sure enough, in selected applications, the TT beats the pants off anything based on an Intel chip. In a lot of other applications, it runs pretty much even with a 25 MHz 80486. And the price is in the 80386 range. Leaves it a very good hardware buy. But the software situation stinks. You just don't see the exuberant blossoming of neat programs to do stuff you wouldn't do with a computer except you wanted to find another thing to do with it. You see programs in important niches compete on lack of bugs, rather than neat features. Configurability is a problem too: not that the other name-manufacturers are any nicer about selling you the machine the way you want it set up, but Atari is the last holdout for LITTLE boxes: if the standard configuration doesn't have what you want, you either hang it outboard, or (in the case of a disk drive, in particular) replace the one it came with. No room to add stuff. Pizza boxes are great as network leaves, but for the one-and-only, lots of room to grow is comforting.
For the future, the notebooks look like super-neat machines (I have some problems figuring out how to market them, but that's not a technical issue).
A successor to the ATW could give Atari a visible presence in education and research. The Mega STe looks kinda lonesome at 16 MHz: if the other STe-s ran that fast, they'd be real challengers in home and small businesses.
So there are still some sparks. Developing for the ST isn't so terribly hard, but there isn't a ton of it happening. The hardware is marketable and marketed, just not as resourcefully as I (we?)'d like to see.
Steve

4142. Looking for gemview via FTP

Source record: 232040

Hi, I need to BITFTP a couple of files for a friend (I owe him a favor!) and I am looking for a program called gemview. It is a program which let's you view a variety of different graphics formats in a window, and can run as a desk acc. Also I need to find soundtracker for the STE which outputs in stereo. (he already has digicomposer).

What I NEED is the exact ftp site name or number, and the EXACT path and filename where I can get it.. Or a mailserver with the EXACT path and filename would do..

PLEASE email because I do not read this group at all and am just posting for a friend..

Thanks in advance,
John

Yes, Tempus works on large-screens, but only if you have version 2.1 already
in your diskette-box. Version 2.05 will not work with screens larger than
640*400. Somewhere in Germany you could try to get a copy of "7UP_ST", an
editor, which is fully gem-based and works with any screensize and any
type of machine (so you don't have to load 24bit on the TT).

Bye.....Michael

The Tweety board is overrated. It absolutely mangles all digitized sound,
and normal sound isn't improved that much. If you have an amplifier that
can handle three separate channels, then the Tweety board may be worth it, but
otherwise, it is impractical.

4145. Blitter Question

Newsgroup: comp.sys.atari.st
Date: 1991-05-19 08:36:20 UTC
From: SYSPMZT@gecrdvm1.crd.ge.com
Message-ID: <91139.043620SYSPMZT@GECRDVM1.BITNET>
Source record: 231756

I must have missed this one (probably about a thousand times), but my new 1040 STe has a 'Blitter' entry on the option screen, which was unchecked when I booted with the ST language disk. I set it on (saving my preferences), and noticed that the graphics did indeed speed up considerably. Can someone explain what the blitter is all about, and why I need to turn it on? My impression was that the blitter was a constant piece of the environment; that is, that it was in the hardware and would always affect the graphics manager.

Thanks,
Phil Z

Hi Roger,

What I've found is that most(if not all) of the ramdisks and formatters break on the new tos. I ended up going to Diamond II to do my backups. Most of the new formatters now work, but unfortunately not the one in Diamondback II(I haven't upgraded yet :{). I use TLCFRT to format,now.

Good Luck
Kent

4148. Disappearing Drives

Newsgroup: comp.sys.atari.st
Date: 1991-05-19 14:44:51 UTC
From: Kent_Cavaghan@mindlink.bc.ca
Message-ID: <5923@mindlink.bc.ca>
Source record: 231979

Hello all,

Ever since I picked up my Mega4 STe, I been having intermitted problems with not being able to access a partition on my hard drives (it seem to happen to all of them at one time or another). I get an error message saying something along the lines of "that drive is not accessable". I can get to the drive by accessing the path line on the file selector and editing it to the apporiate drive. Something else that I have noticed is that I can access the drive but at what appears to be several levels deep (ie: n:*.*) even if the drive is clean.

I have run into this problem when I've got nothing in the auto folder as well as what I've got in there now. It doesn't seem to make any difference. As well, it happens with Atari's hd drivers or ICD's (again, no difference). This was also happening before I added my 2 Rodimes (115 megs).

The only thing that has been consistant is that it happens after a length of time. Sometimes as soon as a couple of hours and in the last case, several days.

Any thoughts or suggestions?

Thanks,
Kent

I have just send the following files to weiner (by mail, 'cause I don't have ftp access any more :-( ).

GRAY.LZH : the example program that shows how to display 256 shades of gray on a mono-monitor. This time with an executeable program, and the possibility to set the program parameters from the command line, load NEO and TIFF pictures (+a lot of bug fixes).

LOAD_INF.LZH : this small program makes it possible to to load a new DESKTOP.INF file at any time, for fast opening of windows for a program. Have a '.inf' file for all your programs. Comes with source, fx a very comfortable binding for the extended fileselector (all Tos versions).

KP_OVERS.LZH : this version of the Overscan driver enchances the old driver at atari.archive. The 'Patch' fixes/adds :
o a bug that ment that some programs wrote one pixel outside the screen, have been fixed.
o the software is 68010/20/30/40 clean. (see doc file)
o the software works on TOS 1.4 and __later__! (it don't use undocumented system variables to enlarge the screen memory any more!)
o it is now possible to disable Overscan, from within a bad program (last resort, as it is not possible to tell accs and the AES about the new screen size).
o it is also possible to enable/disable Overscan from the desktop (general, because it is possible to init. AES and accs).
o the driver is now 3700 bytes, of which 3000 stays in memory, (not counting the larger screen (68Kb)).
This comes with examples on how to intercept TOS and VDI/AES vectores that wont break on new CPUs!

Klaus Pedersen, micro@imada.ou.dk.

4153. PLEASE!

Newsgroup: comp.sys.atari.st
Date: 1991-05-19 20:02:26 UTC
From: jared%midiline.uucp@elroy.jpl.nasa.gov
Message-ID: <Rum821w164w@midiline>
Source record: 232050

Could someone, who uses either MiNT or GEMINI, please inform me how to use either of these 'TOS replacements'. I am very interested in getting my ST to do more and do it more powerfully. What is the latest version of either of these? Where do I put the files, how to I configure it? What does either of these programs do that can make my ST-usage more enjoyable? Are there any bugs, glitches, or errors I should be wary of?

PLEASE --- send an Email reply to me, not here, as I usually only read the last ten messages each day when there are over 20 messages.

Er, in other words, send me an Email reply here (on this system), but not in this net 'sub'. Thanks!

Golden Bear

4154. Display 22 levels of gray on color mon.

Newsgroup: comp.sys.atari.st
Date: 1991-05-19 21:01:50 UTC
From: logajan@ns.network.com
Message-ID: <1991May19.210150.7671@ns.network.com>
Source record: 231952

```
;
; gray22 -- original code by John Logajan 5-19-91, PUBLIC DOMAIN.
; logajan@ns.network.com
;
; This subroutine is called by the ATARI ST COLOR user to go into
; 22 level grayscale display mode (dithered flicker.) Any keys pressed
; from the keyboard will return control back to the user's calling program.
; Keys pressed will not be disturbed and will be available for inspection
; by normal TOS routines. This routine uses 64k just below the normal
; screen RAM area.
;
; This will display a 320x200 minimum window in 22 level grayscale.
; You can have arbitrarily large virtual displays. Scrolling the
; window across the virtual image is accomplished merely by calling this
; program with a new starting (upper left corner) address.
;
; The virtual image must be in the form of one byte per pixel. Legal
; intensity values in each byte range from 0 to 21 (decimal.) The image
; is organized as left to right and top to bottom.
;
; The call to gray22 must include:
;
; A0 set to the window starting point (upper left corner) in the image.
; D0 set to the length of the virtual image horizontal line (bytes).
; D0 should never change unless the virtual image size changes.
; D0 is *not* 320 unless the virtual image size is the same as the
; window size (the window size *is* always 320.)
;
; There are three subroutines below. One initializes everything, one
; restores everything on exit, one displays the window and also has
; an entry point for simply going back into display mode without
; changing the current screen contents (useful for quick returns
; from invalid keypressed keys.)
;
; jsr grayinit -- should be called once to go into low resolution mode.
; Calling grayinit twice or more without intervening
; calls to grayexit will cause original modes to be
; forgotten.
;
; jsr grayexit -- should be called once on exit to restore previous modes.
; Don't call grayexit if you haven't yet called grayinit.
;
; jsr gray22 -- should be called with A0 and D0 set, to update display.
; Don't call gray22 if you haven't yet called grayinit.
```

```
;
; jsr grayshow -- should be called to bypass update and continue previous
; display. gray22 automatically executes grayshow.
; Don't call grayshow if you haven't yet called grayinit
; and gray22 at least once.

;
; Here is gray22, be sure to have called grayinit before calling this.
; Also be sure to set A0 and D0 before each gray22 call.
;
gray22: move.l a0,corner ; save the starting corner

sub.l #320,d0 ; compute and save the window factor
move.l d0,wrapit
;
; We get 22 shades of gray by flipping between three screens each
; with different combinations of eight shades of gray (the atari
; hardware limit.) The table below shows the general theory:
;
; Screen Screen Screen
; 0 1 2 Shade 0 1 2 Shade 0 1 2 Shade
;
; 7 7 7 21 4 4 5 13 2 2 1 5
; 7 7 6 20 4 4 4 12 1 1 2 4
; 6 6 7 19 4 4 3 11 1 1 1 3
; 6 6 6 18 3 3 4 10 1 1 0 2
; 6 6 5 17 3 3 3 9 0 0 1 1
; 5 5 6 16 3 3 2 8 0 0 0 0
; 5 5 5 15 2 2 3 7
; 5 5 4 14 2 2 2 6
;
; In addition, to keep flicker to a minimum, we phase dither each intensity
; with a three horizontal by three vertical pixel intensity interlace.
; For instance, a block of intensity-18 pixels would be displayed as such:
;
; ... First Screenful ... ... Second Screenful ... ...Third Screenful...
; ... 6 6 7 6 6 7 6 6 ... ... 6 7 6 6 7 6 6 7 ... ... 7 6 6 7 6 6 7 ...
; ... 6 7 6 6 7 6 6 7 ... ... 7 6 6 7 6 6 7 6 ... ... 6 6 7 6 6 7 6 ...
; ... 7 6 6 7 6 6 7 6 ... ... 6 6 7 6 6 7 6 6 ... ... 6 7 6 6 7 6 6 ...
; ... etc ... ... etc ... ... etc ...
;

;

I'd be very interested in this, I'm not on as often as I'd like and so its easy to miss things. Also could you post instructions on getting at things via mail on a regular basis, again I have all sorts of problems with this (usually hosts justs ignoring my pleas for help :-(

>
>I am about to install the System 7 into my Spectre within 8 hours, from
>original installation disk set.
>I'll tell you about the results as soon as I can.

Here are the results:

It can be installed with no problems (when you try, make a backup at least
of your System Folder) but it crashes on bootup. Or does not start, actually.
No crashpage comes up ay the first time. But when you follow the instructions
given in that error message, you will definitely call up the crashpage.
It makes something unrecoverable, because after trying once, you won't get
anywhere with it withhout a hardware reset...

I tested it on a Mega4, TT may give different results.

...We are waiting for you, Dave...

4158. Using Mac fonts

Newsgroup: comp.sys.atari.st
Date: 1991-05-19 22:49:34 UTC
From: tdrga@ccwf.cc.utexas.edu
Message-ID: <49233@ut-emx.uucp>
Source record: 231955
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My questions to the net:

What do I have to do to use some of the Mac fonts that I have found archived on various FTP servers? What program will convert the to GDOS (or other) fonts that I can use? I am interested in using the fonts for DTP and screen fonts.

I am ignorant when it comes to Mac file structure, systems, etc. The doc files for some of the fonts mention things like 'Font DA Mover file' 'suitcase file' 'resource forks' etc. what do these mean *to me* as an Atari user? How easy is it to convert these various file types into something my machine can read/use?

Are there UnBinHex and UnStuffIt programs for the ST or UNIX? Or do I have to find a Mac to unarchive these files? (I have a general idea what BinHex and StuffIt do - they are comparable to uuencode and ARC/LZH, respectively - or is this not the case)

Thanks,

Todd
(E-mail replies if you have to explain something really trivial that I got wrong. Otherwise, post if it is of general interest)

All TT owners ATTENTION!

Whoever you are and whereever you are, if you own/use an Atari TT,
please hit the reply now!

All I need is your .signature or something that tells who you are and
where I can reach you.
I need to discuss about a matter that cannot be discussed in public here
in comp.sys.atari.st.

Just reply to this, no further claims/responsibilities, if you don't want...

```
--
Now running Sys7 on my Mac LC with 10 meg RAM and upgraded video RAM (ie,
256 colors at 640x480). It is slower than 6.0.7, but I am now running
with full
multi-color icons and all thr trappings. That makes it slow. Sys7 with
bitonal
icons (ie, any one icon is only one color), it seeme to be quite zippy.

Of course, I am on a 16mz 68020. Id hate to see it on a 1040 plus GCR.
(then again,
I thought my plus was kind of slow...)

>A long time ago, someone posted here or the info-atari16 digest, that
>they had a modified Dumas' uud, which accepts the multi-part files all
>concatenanted into one stream. Does anyone have this?

Get the file 'uux789.zoo' from atari.archive.umich.edu in the archivers
directory. It contains TOS executables uud.ttp and uue.ttp. It also has
source code for both the encoder and decoder that may be compiled under
GEM, UNIX, and MS-DOS.

The uud will work with multi-part files that are concatenated in order. It
also works if the files are just in the same directory as the first file
provided they are properly named.

There is a doc file included.

I use these programs on my ST and on the UNIX box here. My only 'complaint'
is that sequence checking is only done on the first file of a multi-file set.
However, it hasn't bothered me enough to get me to look at the sources to fix
it. 8^)

>find another thing to do with it. You see programs in important niches compete

The software situation does smell pretty bad. I use Macs a lot for graphics, and I can probably list about 10 packages off the top of my head with plenty more I've never seen. The Atari arena doesn't have this diversity.

People always say that there's not much software selection in the ST community. What kinds of stuff would people, not just you Stephen, be interested in? It seems we have a ton of utility packages, but very few applications.

>on lack of bugs, rather than neat features. Configurability is a problem too:

>one it came with. No room to add stuff. Pizza boxes are great as network
>leaves, but for the one-and-only, lots of room to grow is comforting.

Here's where the 'speed without the speed price' comes in. One of the ways that Atari keeps the prices of their computers low is by making them unexpandible internally. I don't understand why this is exactly, but adding slots for cards and stuff drastically adds the price to a product. I don't know why making a case a bit bigger with a few ports on the *inside* would raise the price of a product but it does. (This theory doesn't apply in the MS-DOS world because there's so much competition, it lowers the price of the products.) It's not just Atari, but other manufacturers lower their prices for machines that are more unexpandible than others. NeXT cube vs. slab. Amiga 500 vs. 2000. Mac IIsi vs. ci.

(Please let me know if you see holes in this theory. :^)

>ran that fast, they'd be real challengers in home and small businesses.

The STe is fine at 8Mhz. The only thing holding it back is marketing from
Atari. A home machine doesn't need to be 16Mhz, although I know everyone
would like to have a 16Mhz machine for the same price as their 8Mhz.

4163. Turtle and Mega STE behaviour

Newsgroup: comp.sys.atari.st
Date: 1991-05-20 05:08:37 UTC
From: hohr@cernvax.cern.ch
Message-ID: <5320@cernvax.cern.ch>
Source record: 231963

Hi Atarians,

Just time to do a back-up on my Mega STE/4. So I decided to stop
the manual back-up story and use Turtle V3.20.

But when I start it, I just get the following message:

Memory configuration will fail -

TTLEXEC.TTP: 1303D6 - 13CBF4
RAMdisk: 7C12C - 1303D5
Screen: 3F8000 - 3FFCFF

I tried to .ACX all my .ACC, to .PRX all my .PRG in the \AUTO\,
still the same message. Notice that the last value of the 'Screen'
line is weird: should it not be 3FFFFF?

Anyone an idea???

Thanks in advance for your help/reply.

Roger hohr@cernvax.cern.ch

Boy do I wish the TT was around when the Mega came out. I was holding
my breath for a TT... but couldn't hold it that long.

About the TT and Unix... For us (ordinary?) gem/tos users, how close to
Unix can we get on a TT running the Unix like packages available?

Mint/Bash comes to mind.... All I've used is MSH (Mark Williams Shell
from their compiler disk...)

Seems to me there's UUCP available, couldn't we run rn, send and msg
along with our favorite c compiler? For me... thet's all I need.
(I think... Back when the 8-bit came out I thought all I needed ead
Atari Basic....)

I still want a TT system unit with TOS, no HD, and no Monitor.
Don't much care for factory ram expansion either. But I don't want it
crippled. I have serious doubts a machine like this is possible, but if
it were, it wuold be purchaced(sp?) by me..., and probably a few other
'loyal' Atarians. Sheesh.... It couldn't cost over $1200 to $1400...
could it? Possibly less!

Neatest thing about this machine is it would activate Atari USA's best
advertising network... a bunch of satisfied owners.... who could show
anyone a fast low-priced system...

>
>Before you "start work" please check to see if TOS's and MiNT's own
>filesystem isn't what you need. They *are* MSDOS compatible. You can
>take TOS disks and use them on PC's.

Yes, but ultimately the aim of MiNT is surely to completely replace TOS. And, by the way, the ST cannot cope with disks with a number of FATs other than 2, or floppies with sector sizes >1024 bytes (unusual, I admit :-), and doesn't handle disks with FATs of size != 5 sectors correctly.

>Well, that's not quite true. They have to be formatted by a program which

>like DoubleClick, let you select this as an option. There is no difference
>at all in the data part of the disk, only a couple of bytes in the first
>sector which we ignore and they use.

I have an STe, and this does the correct formatting.

>Sometimes you can format a disk on a PC and use it on an ST. You can
>certainly READ the disk on the ST. You can't WRITE it unless the disk was
>formatted with two FATs. Some newer MSDOSes think they're doing you a
>favor by writing just one FAT. If you have one of those, use the option to
>FORMAT which says, "Put two FATs on the disk."

I often use disk formatted on an Amiga under MSH: - if I give them only one FAT, or FATs not of 5 sectors, my ST CANNOT read them (I have to use DiskEdit to get the files back). Of course, if I format the disks on my STe, I have no problems.

>Aside from these details of formatting (which are not minor), the TOS
>and MSDOS filesystems are identical, files, subdirectories, and all.

I notice that some versions of MS-DOS (DOS 4.0 on a PS2 I know) save a mixed case filename on the disk (at least on the hard drive). But the ST doesnt' mind too much if I take a sector editor to a disk and change the case of the directory entries.

I hope this has helped clarify my reasons for attempting this project. But please, nobody hold their breath: it won't even be ready for testing until late this year (October of November at the earliest) as I'm going to be away from my STe over the summer (woe is me :-( ).

Message-ID: <BAMMI.91May20112418@acae127.cadence.com>
Source record: 231975

the GCC-TOS library handles the '/' (automatically) and long file
names(optionall), so "d:\tmp/cc100000.s" will map to the file
"d:\tmp\cc100000.s". if you get errors such as cant find.... etc.
there are two common problems (these should probably be added to the
FAQ list)

-- you extracted the gcc zoo archives with a old version of ZOO. that
version of zoo extracts '-' in file names as '_' (dash as underscore).
this causes problems when gcc.ttp tries to run say the preprocessor,
which it cannot find, and complains that the file the preprocessor was
supposed to produce is not found. the solution is to rename all files
"gcc_XXX.ttp" to "gcc-XXX.ttp". (i dont know what versions of zoo are
available on atari.archive, but zoo201.zoo does'nt have the problem.)

-- another common problem is people not setting up the four
environment variable GCCEXEC, GNUINC, GNULIB and TEMP correctly.

-- a less frequent problem is gulam users not setting "set env_style mw"

-- a slightly bigger problem is people not reading the docs in
Documentation.zoo

-- a more serious problem is people giving wrong advice on the net
based on (unintelligent) guesses or showing quite obviously that they
have'nt even bothered to read the README files, let alone the
documentation, as the last two follow up's to the origonal posting
clearly show.

While it is said that IBM is an MS-DOS computer, it is not actually true. The majority of IBM/IBM compatible users DO use MS-DOS, but that isn't to say the machine is bound to the limitations of an outdated piece of software being pushed well beyond its limitations.

Nay, an IBM can service under many different Operating Systems, infact, I wouldn't even consider using my IBM to run MS-DOS, what's the point?

Now, I do love my Atari, don't get me wrong, bnt it also has a number of visable faults which irritate me. For instance, the TOS chips aren't as accesible as they should be. The 3.5" 720k floppy doesn't have is much storage as it should. It doesn't multitask (this is a biggy) and it doesn't have the dazzle of the hi-res sprites/colours of an Amiga.

Unless Atari fixes up the new STE's, turns it into a cheap, affordable and POWERFUL machine, the company is going nowhere. The TT's and the Mega STE's are a step in the right direction, but price still detracts buyers and sends them the IBM way. The consequences to Atari should be crystal clear. Power without the price. Live up to the motto and support your machines.

Yup, I think posting a list of the weeks uploads is a good idea.
I also think think that you should maintain an ls -lR listing of
the archive as well as the commented listing. This enables far
away users with poor news feed the ability to find out what
software and online mags are new by diffing the last listing
they downloaded with the new listing.

That's exactly the problem. In the inexpensive utility field, people will buy several similar products and use the one that suits them best. For applications, the prices tend to be higher, and people tend to get just one of each kind. This makes the competition more serious. So we have the potentially interesting spreadsheet and database markets dominated by one or two maximally PC-compatible products. Native ST products don't generate the cash to support much 'market presence'. The exceptions are in the fields where the ST really shines: MIDI, CAD and DTP. But in general, the ST market doesn't presently support 'secondary' applications in big markets (that means something like Ami or Professional Write in PC word processing), and doesn't support any commercial products in minor markets.

Consider me as part of the problem. As I endlessly repeat, I have a Stacy-specific application ready to go. But it probably won't appeal to many musicians. There aren't enough Stacys out there to justify the effort of publishing the thing.

I guess the moral of this part is that the ST family needs *SUPER-KILLER* applications to make the whole thing big enough to support the ordinary applications. It may happen. It's more likely to happen as the machines get better.

The hole in the theory is that 'PC boxes' have become commodity items. You

can put anything you like inside of one. How about 'office models' added to the Atari line: the same electronics, but in a 'PC box', with an Atari nameplate, for a mere $100 or so extra. Define a bus for expansion cards using the ISA-type connectors. Don't get me wrong: Atari has some of the nicest industrial design work around, but sometimes it's necessary to go with a clunker to get functionality for the dollar (don't jump on me: sure, a good design saves money when you're going from scratch: these are COMMODITY clunks)

>

No. Just no. The potential killer application for the ST series is desktop publishing (I think, anyway). It gobbles cycles like Gargantua. And the potential 'nose of the camel' to get Atari boxes into 'respectable' places is transparent network connectivity, which also gobbles cycles. I sure hope those faster STe-s are already breadboarded somewhere.

Pardon my ignorance, but I don't know anything about AutoDesk software. Assuming AutoDesk is a company, what do they produce? (If it's a product, what is it?)

I asked a question recently about Tom Hudson's whereabouts, but got no reply. I know Mike Vederman's usually very good about passing on information, so I'm wondering if my messages are getting out to the world. If you have time, and live in (let's try to restrict this) the Southern or Western USA, could you please mail me a *short* acknowledement that you've seen this message? Thanks.

>fonts.

FONTZ! from Neocept will do this conversion. The documentation
that comes with it gives all the necessary information.

>I am ignorant when it comes to Mac file structure, systems, etc. The doc
>files for some of the fonts mention things like 'Font DA Mover file'
>'suitcase file' 'resource forks' etc. what do these mean *to me* as an
>Atari user? How easy is it to convert these various file types into something
>my machine can read/use?

The documentation with FONTZ! gives all the necessary information
about this. Perhaps the most important thing to know before
starting is that the font files downloaded from Macintosh archive
sites or BBS's must be separated into files each of which
contains one size and style of one font. This requires the use
of the Font DA Mover on the Macintosh (the program that moves
fonts and desk accessories between files); it can be run under
Spectre on an ST. Also, because the screen and printer
resolutions for the Atari and Epson campatible printers differ
from those for the Macintosh and the ImageWriter, the fonts will
convert to odd sizes, and transforming them for use on the ST
will require rescaling them. In my experience, this rescaling
requires checking the design of each character, and can be very
time consuming. I believe that some of the fonts which can be
legally circulated have been converted for GDOS use and, if I am
not mistaken, the results are available on atari.archive.

For those who are interested, Macintosh files come in a format
that combines a text part and a binary part; these parts are
called, respectively, the data and resource forks. Because of
this special format, transferring a binary file between a
Macintosh and a system like the ST or UNIX requires special
software at both ends. For those who have Spectre, the program
Transverter will do this kind of transformation; since my UNIX
host does not have the necessary UNIX end of the special transfer
software, when I want to download a binary Macintosh file, I
transfer it to my ST using Kermit (since my host does not have
x-modem or y-modem) and then use Transverter to get it into

Macintosh format.

>Are there UnBinHex and UnStuffIt programs for the ST or UNIX? Or do I have
>to find a Mac to unarchive these files? (I have a general idea what BinHex
>and StuffIt do - they are comparable to uuencode and ARC/LZH, respectively
>- or is this not the case)

There are such programs for UNIX; mcvert for UnBinHex and unsit
for UnStuffIt, both obtainable from archive sites. But I do not
know of any program running under UNIX that will separate fonts
into separate files, which is what is needed to use FONTZ! So to
convert Macintosh files for GDOS use, you will need a real
Macintosh or Spectre.

>Thanks,

You're welcome. I hope this helps.

4177. CAD 3D Problem

Newsgroup: comp.sys.atari.st
Date: 1991-05-20 17:58:31 UTC
From: rdf@pinet.aip.org
Message-ID: <1991May20.175831.29112@pinet.aip.org>
Source record: 231983

I am having a problem with CAD 3d version 2. I recently purchased a second hard drive. In order to get GEM to see it I must run something call INSTAL from Berkeley Microsystems in my Auto folder. I am booting using Atari AHDI 3.01.
When I do this CAD 3d bombs out. If I do not install the second drive when booting the program runs ok. Does anyone know of an alternate startup program that will allow access to all drives and still permit Cad 3d to run?
Thanks...

4178. In search for a curses package for Atari ST.

Newsgroup: comp.sys.atari.st
Date: 1991-05-20 18:14:39 UTC
From: elrond@frmug.fr.mugnet.org
Message-ID: <1991May20.181439.25063@frmug.fr.mugnet.org>
Source record: 231999
Cross-posted to: comp.sources.wanted,comp.sys.atari.st,comp.sys.atari.st.tech,alt.sources.wanted

I am searching a surses package (in C source code format) for the
Atari ST. It would be great if this package can handle termcaps but i can live
without this.

Please don't post a follow-up because i don't read all of theses
news-groups so e-mail me!

>haven't upgraded yet :{). I use TLCFRT to format,now.
>

The latest version of Diamond Back II is format compatible with the new TOS
versions and also adds full TT compatibility and support for all alternative
video modes(TT Hires, TT Medres, ISAC, Moniterm, Overscan). You can get your
upgrade(and you'll be glad you did because it includes Tons new features and a
new manual) by sending your original disk and $7.50 to:

Oregon Research Associates

> fonts.

Font DA (desk accessory) mover is an application on the mac that adds
fonts or desk accessories to the system file... in other words, it sort of
puts them in the assign.sys file (or root dir for accesories) The fonts are
not (I repeat: are not) separate files... they come in bunches... like 20
fonts in one file... GDOS fonts come one by one (great system... I love my
atari... why make things complicated???)
I have no idea what the file format of the font files on the mac is...
that's just the thing with the mac... you never know what the hell is
going on in your computer... however, I'm an expert on gdos fonts... I
just finished a program that outputs them to my 9 pin dot matrix without
using gdos, or any system routines for that matter.

So, if you find some specs on the mac fonts, and need help converting
them... let me know, maybe I'll throw some ideas at you or something. :)

4181. SCSI docs info and request

Newsgroup: comp.sys.atari.st
Date: 1991-05-20 20:36:19 UTC
From: kiki@uhccux.uhcc.Hawaii.Edu
Message-ID: <13127@uhccux.uhcc.Hawaii.Edu>
Source record: 231984

NCR has a SCSI BBS at (316) 636-8700 [Wichita, Kansas] which archives a lot of SCSI documents. If anyone is able to make a local call and download the SCSI 1 and 2 Standards docs [S1R17B.ZIP (133K) and S2510-C.ZIP (388K)] and post them to atari.archive.umich.edu, it would be appreciated! The NCR BBS at Colorado Springs, CO [(719) 596-1649] might have the files too, although I didn't check.

The NCR Literature Center [800 334-5454, (719) 596-5612] will mail the 5380 SCSI chip design manual to anyone interested.

The BBS also posted these references:

Product Support Data Sheets, etc.

How to Get SCSI Standards
(and other SCSI Publications)

This file contains information on obtaining the various SCSI standards and other published information about SCSI. If you know of other published material on SCSI that should be included here, please leave a message on the SCSI BBS or send a Fax to John Lohmeyer 316-636-8889.

American National Standard (ANSI) for Small Computer System Interface (SCSI), X3.131-1986. This approved standard is available from:

American National Standards Institute
11 West 42nd Street, 13th Floor
New York, NY 10036
Sales Department: (212) 642-4900

You can also buy ANSI standards from Global Engineering Documents. The cost is slightly higher, but their sales people are much more helpful and your order will be processed more smoothly. Most committee draft documents are also available.

Global Engineering Documents
2805 McGaw
Irvine, CA 92714
(800) 854-7179 Outside USA and Canada: (714) 261-1455

X3T9.2 documents available from Global Engineering Documents include:

Small Computer System Interface (SCSI-1) [X3.131-1986]
Small Computer System Interface - 2 (SCSI-2) [X3.131-199x] {Rev 10d}
SCSI-3 Parallel Interface (SPI) [X3T9.2/91-10]
SCSI-3 Packetized Protocol (SPP) [X3T9.2/91-13]
SCSI-2 Common Access Method Transport and SCSI Interface Module (CAM)
[X3T9.2/90-186] {Rev 2.3}
AT Attachment (ATA or IDE) [X3T9.2/90-143] {Rev 2.3}
Enhanced Small Device Interface (ESDI) [X3.170-1991]

For sale Mega2ST

I have a Mega2ST with:
-Both Monitors
-1200 baud modem
-20 meg HD
-Monitor master switch
-Word Perfect
-VIP speadsheet
-A couple of games
-Personal Pascal
-Tackle Box for Personal Pascal
-and other misc stuff

Please, make me an offer

send email to freds@hpspdra.hp.com

I'm located in Palo Alto CA.

thx Fred

4184. AIM offer to STart subscribers

Newsgroup: comp.sys.atari.st
Date: 1991-05-21 02:35:18 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <42543@cup.portal.com>
Source record: 231981

This Press Release appeared this weekend on CompuServe. I'm reposting it for anyone here who had a current subscription to STart magazine.

May 18, 1991

Unicorn Publications 3487 Braeburn Circle Ann Arbor, MI 48108

FOR IMMEDIATE RELEASE CONTACT: Pattie Rayl (313) 973-8825

TO: ALL STart Subscribers

UNICORN PUBLICATIONS OFFERS START SUBSCRIBERS DISCOUNT TRIAL SUBSCRIPTIONS TO ATARI INTERFACE

Ann Arbor, MI -- Unicorn Publications, producer of Atari Interface magazine, today announced special discount trial subscription rates for current STart subscribers.

As most STart subscribers already know, Antic has ceased publication of STart. This is a tremendous loss to the entire Atari community, and an even greater loss to the many STart/Antic subscribers out there. With the loss of STart, Atari Explorer and Atari Interface are the only commercially internationally-distributed, US-based magazines left supporting Atari 8-bit, ST and TT users.

In the past few years, Atarians have seen many of their favorite magazines disappear from the shelves. In fact, a number of STart subscribers were "converted" from ST-Log/Analog subscriptions.

Here at Unicorn Publications, we know how hard it is for Atarians to commit to subscribing to an Atari publication nowadays. That's why we're thankful for each and every one of our nearly 3,000 direct subscribers to Atari Interface. That's also why we're offering trial six- and 12-month subscriptions to Atari Interface at special prices ONLY for STart subscribers.

For a limited time, current STart subscribers residing in the US can subscribe to Atari Interface for only $12 for 12 issues (an $18 value). That's right, only $1 per issue, delivered direct to your door! Plus, we'll throw in an ST or 8-bit disk, absolutely FREE! [Special rates for Canadian residents: $24 (regularly $30); Foreign residents: $30 (regularly $36). All prices are in US funds.]

If you're just not ready to commit to a full year's subscription, we're offering a special six-month (six issue) trial subscription for only $6. The six-month subscription does not include a free disk.

To start receiving Atari Interface at this special trial rate, just send a copy of the mailing label from your last STart magazine, or a photocopy of the disk label from your last STart disk if you didn't save the magazine wrapper, along with a check or money order for the appropriate amount. If you're signing up for 12 months, don't forget to indicate whether you want an ST or 8-bit disk. Make checks payable to Atari Interface or Unicorn Publications.

This is a one-time-only offer to all current STart subscribers and does not apply to subscriptions to the Atari Interface ST or 8-bit Disks of the Month. This offer is good only until August 31, 1991. All subscriptions taking advantage of this offer must be postmarked by that date.

If you're still not convinced, we're willing to send you a recent copy of Atari Interface FREE OF CHARGE! Send us your name and address and we'll send you a copy of the magazine.

Unicorn Publications has been producing an Atari-specific publication since December 1987. Originally called Michigan Atari Magazine, Atari Interface currently has a monthly circulation of nearly 8,000 issues and is distributed world-wide. The magazine is currently available from most major bookstore chains (such as Walden's and B.Dalton's), independent bookstores/newsstands and from select Atari dealers across the US and Canada.

I think I got an error during the unlzh as well, but I tried to unMSA it
to disk and it worked, but locked up prematurely. The result is that
the big demo works fine, but there's a newer(?) version of Esion also
on the disk, and I get two bombs when I run it.

>
>Is there something special I should do, or is it corrupted?
>

I downloaded it twice and got the same result each time.

Well, after reading all of that, I have decided to give up on converting mac fonts. I don't have and there is no way I can afford Spectre, so that blows the whole thing out of reach.

I did find source for the unbinhex and unstuffit programs at sumex.stanford.edu (thanks to the person who suggested it) along with some other mac conversion programs.

The good thing to come out of my abortive attempt is that I compiled my first programs on the Sparc here at school. (this is coming from an dictionary-definition end user, so its a big deal to me)

Thanks to everyone who helped me out. Maybe someday I'll be able to afford Spectre. (hah, right!)

4188. vro_cpyfmt() blues

Newsgroup: comp.sys.atari.st
Date: 1991-05-21 10:46:17 UTC
From: lsmichae@immd4.informatik.uni-erlangen.de
Message-ID: <1991May21.104617.26475@informatik.uni-erlangen.de>
Source record: 231989

I have some problems with the VDI function 'copy raster opaque'.

I tried to save (and restore later) a rectangular area of the
hi rez screen.

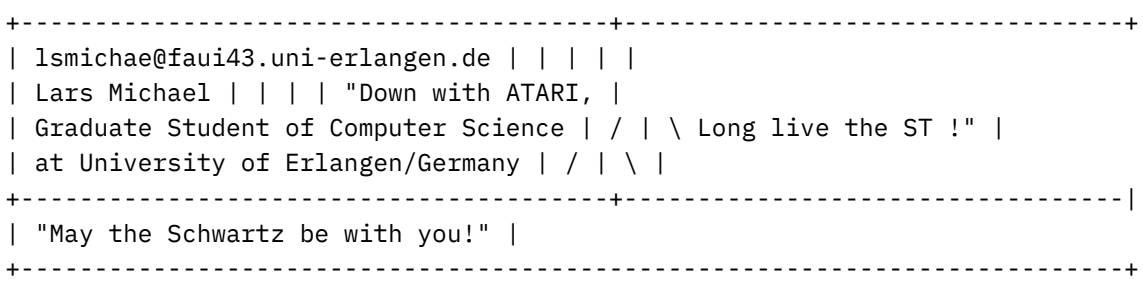
I've used follwing routine:

```
VOID copy_block(dest_adr, src_adr, x, y, w, h)
BYTE *dest_adr;
BYTE *src_adr;
WORD x, y, w, h;

{ WORD line;
MFDB dest_mfdb;
MFDB src_mfdb;
WORD pxyarray[8];

line = (Getrez()==2)?80:160; /* get number of Words in scanline */
src_mfdb.fd_addr = src_adr;
src_mfdb.fd_w = work_out[0]+1;
src_mfdb.fd_h = work_out[1]+1;
src_mfdb.fd_wdwidth = line;
src_mfdb.fd_stand = 0; /* use device specific format */
src_mfdb.fd_nplanes = 4>>Getrez();
pxyarray[0] = x;
pxyarray[1] = y;
pxyarray[2] = x+w+3;
pxyarray[3] = y+h+3;

dest_mfdb = src_mfdb; /* dest_mfdb is identical .. */
dest_mfdb.fd_addr = dest_adr; /* except the address */
pxyarray[4] = x;
pxyarray[5] = y;
pxyarray[6] = x+w+3;
pxyarray[7] = y+h+3;



(VOID) v_hide_c(VdiHandle);
vro_cpyfm(VdiHandle, 3, pxyarray, &src_mfdb, &dest_mfdb);
(VOID) v_show_c(VdiHandle, 0);
}
```

The routine will be entered by a call like

```
copy_block(Logbase(), temp, xdial, ydial, wdial, hdial);
```

Now, can someone tell me, what's wrong ?

DISTRIBUTION
------------

This list may be distributed and copied for non-commercial
use, as long as the Gooey (GUI) BBS is given credit and its
data phone number is disclosed (212-628-5486).

DISCLAIMER
----------

The BBSs in this listing have not necessarily been verified.
Inclusion in this listing simply means that the information
supplied by the sysop of the listed BBS has provided
information which would entail the suitability of his system
for being labled as a "Graphical User Interface supporting
BBS." Therefore, there are no warranties that the systems
listed are operating or are as described. Thus, The Gooey BBS
and its affiliates will bear no responsibility for errors
contained, and all warranties are hereby disclaimed.

SUBMISSIONS
-----------

The information listed in this listing must be provided by
the owner, sysop, or cosysop of the BBS in question. This is
the only check that I have on the information I obtain. As
much of the following as possible should be sent:

BBS Name
Owner's Name
Sysop's Name
Phone Number(s) and Corresponding Modem Type
BBS's City and State/Province, Country
System Configuration:
```

Hard Drive(s) Space and Type
CD-ROMs? and Software
LAN? Type
BBS Software Type
of Nodes
Subscription Required? (Rates/False)
Networks the BBS is part of:
Network Address (Fido/UUCP/PCRelay ID/etc.)
Focus:
Windows OS/2
Amiga Atari ST
Macintosh X/Windows / DESQview
GEOS Ensemble Deskmate
NeXT Sun
etc.
Additional Comments:
Hours Open, etc.

Submissions can be mailed over the INTERNET to
bigd@dorsai.com; sent to David Shapiro, routed to ->GOOEY
in the RelayNet (RIME) Common conference, the Intelec
PCRelay or Windows Conferences, or the MIDILink common conf.
Submissions can also be sent in any GUI-Net conference, or
by logging onto the Gooey (GUI) BBS @ 212-876-5885 (9600
CSP) with the name "GUILIST" and the password "SUBMISSION"
and filling out questionnaire #10.

If any information becomes outdated, or if the BBS is no
longer in operation, or if a new category of information
is developed, notification of the new information
would be beneficial to all.

>I HOPE will look elsewhere, you people REALLY don't want this, I would take
>a UNIX command line over MULTI GEM! Hopefully atari will be realistic and
>go the UNIX/MOTIF route.

I like GEM. I _need_ MultiGEM. GEM does almost anything the MacOS will do
for you. MultiGEM will do almost anything a Mac with MultiFinder does for
you. So how can you tell us nobody wants a multitasking TOS?

>GEM is brain dead, it never will amount to anything. I wish I could reclaim
>my ROM space IMMEDIATELY.

It's not brain dead. It works. It's quite fast, if you compare it with Windows.
It's easy to program. And I like it. Please don't think ATARI must be
a bunch of fools just because they don't follow your way of thinking.

```

Using Getrez() here is a major sin. You can calculate them from work_out[0],
and you can even forget about these parameters if you use the method
suggested below.

```
> src_mfdb.fd_addr = src_adr;
> src_mfdb.fd_w = work_out[0]+1;
> src_mfdb.fd_h = work_out[1]+1;
> src_mfdb.fd_wdwidth = line;
> src_mfdb.fd_stand = 0; /* use device specific format */
> src_mfdb.fd_nplanes = 4>>Getrez();
```

Again, this is a SIN.

```
> pxyarray[0] = x;
> pxyarray[1] = y;
> pxyarray[2] = x+w+3;
> pxyarray[3] = y+h+3;

> dest_mfdb = src_mfdb; /* dest_mfdb is identical .. */
> dest_mfdb.fd_addr = dest_adr; /* except the address */
> pxyarray[4] = x;
> pxyarray[5] = y;
> pxyarray[6] = x+w+3;
> pxyarray[7] = y+h+3;

> (VOID) v_hide_c(VdiHandle);
> vro_cpyfm(VdiHandle, 3, pxyarray, &src_mfdb, &dest_mfdb);
> (VOID) v_show_c(VdiHandle, 0);
>}

>The routine will be entered by a call like

>copy_block(Logbase(), temp, xdial, ydial, wdial, hdial);
```

Don't use Logbase() in a VDI context. Just use 0L as a pointer to
the current screen. VDI will automatically convert this to the
actual address needed and will even fill in the word width and plane
count parameters in the MFDB automatically!

4196. Mac fonts to gem...

Newsgroup: comp.sys.atari.st
Date: 1991-05-21 12:36:37 UTC
From: <>
Message-ID: <1991May21.123637.25466@dcs.glasgow.ac.uk>
Source record: 231853

Mac fonts are in a totally different format from gem fonts. On the macintosh, they are installed in the system file using a program called 'Font D/A Mover'. (Font D/A Mover files have a little suitcase icon). All macintosh programs can use these font 'resources' in the system file, and the fonts are loaded into memory automatically when requested. All macintosh files consist of two parts, the 'data fork' and the 'resource fork'. The data fork contains all of the data associated with the file, and the resource fork all of its resources. In the case of a program, all of the programs code is in the resource fork, and its initialised data in the data fork. The resource fork also contains the dialog box templates, window definitions etc. In the case of a document, it is most likely that the resource fork will be empty, and the data (e.g. text) will be in the data fork. Mac fonts can be converted to gem format using the program 'mac2gem' which is supplied with 'Fontkit Plus' from the ST club. (20 quid and well worth it...) Mac fonts are available from quite a few archive servers and also from PD disc suppliers. Using the above program is simplicity itself, however if you wish screen and printer fonts, then you will have to edit them yourself from the screen versions (on the mac, there is no difference between screen and printer fonts, unless a laser printer is being used which will contain higher res versions of the screen fonts) - this is the main purpose of Fontkit.

N.B. The ST Clubs address is:

49 Stoney Street
Nottingham
U.K.

(20 quid is 20 pounds sterling - I didn't notice that you from the US.)

It already is. Also note that the original posting about "Getting GCC 1.39 up and running" (which I posted about a month ago) also has GCCEXEC plainly definied with a trailing '-' ... primarily because this is the way that the GNU.G file for the Gulam shell was set up.

> line = (Getrez()==2)?80:160; /* get number of Words in scanline */

Don't use Getrez(). This code will crash under nearly all graphics cards
(MATRIX, MGE, OverScan, Reflex) and even on the TT.
If you blit to / from the screen you must set fd_addr = NULL. In this
case all other values are filled in by the VDI. You can't know how many
BytesPerLine the actual graphics card has.
For the 'offscreen' MFDB, you must use w/16*planes. It does not matter if
the BPL in the offscreen area is different to the screen MFDB (As in
OverScan mode or with the Reflex card), the VDI handles this correctly.

> src_mfdb.fd_nplanes = 4>>Getrez();

You get the plane count with the vq_extend call or in the AES global[10]
array but NOT with Getrez()!

>The routine will be entered by a call like
>copy_block(Logbase(), temp, xdial, ydial, wdial, hdial);

Don't intercept VDI and XBIOS calls. The Xbios calls are only for the
'main console' of the ST and not for a graphics card. (But most cards
have an emulation of the calls). If you use Getrez() with a Matrix card
installed, you will get the rez of the (probably not connected) ST-monitor.
With Physbase(), Setpallete, Setcolor there is the same problem.

>Now, can someone tell me, what's wrong ?

Your main 'bug' is in the pxy array. The '+3' copys more memory lines than
possible, so you get an bus-error in the color resolution.

>GDOS works if I don't use the harddisk, so I guess the problem is the disk
>driver.

One common problem I've found is that GDOS (both AMC and Atari flavours)
require the fonts and graphic device drivers to be on the same drive as
GDOS. I use a small boot partition to hide away all the stuff I don't
normally want to look at, but was defeated when I wanted to then temporarily
use some fonts on another drive which wouldn't fit on the boot drive...

It can be done, but not with the MIDI port: the sound of the soundchip is
available at a pin at the monitor port (the manual says whichone it is, I cant
remember it now), so all you have to do is just plug in an interfacebox
(selfmade) or put a cynch-plug into you atari (I have done so) connecting it
with the outputpin at the monitor plug, its really easy to do and it sounds
great!!

Is there something unusual about the hard drive? The usual situation is that one simply runs AHDI and any number of ACSI-SCSI drives are recognized. I've run 2 hard drives off a BMS-200 that way (along with a cartridge tape). It is just imaginable that you're installing 2 conflicting hard disk drivers. Have you called BMS with this problem? They tend to be very helpful.

4203. TT memory question

Newsgroup: comp.sys.atari.st
Date: 1991-05-21 18:35:34 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1991May21.183534.22211@ecst.csuchico.edu>
Source record: 231856

Basically, how is the RAM in the TT configured?

From reading reports in STart (R.I.P.:^) and Atari Explorer, I get the impression that both ST- and TT-RAM are banks of DIPs (correct term?), with the TT-RAM requiring a daughterboard. Moreover, Atari does not sell this daughterboard separately. So the only way to get TT-RAM is if the machine is shipped with at least 2megs of TT-RAM from the factory, and then, I suppose, more TT-RAM can be plugged in later.

About a month ago on Freenet, someone said that a dealer told him that the TTs were being shipped with SIMMs for both ST- and TT-RAM and that no daughterboard was necessary.

Which is the correct story here? As much as I'd like to believe the latter, the former sounds more plausible, at least because it was reported in a magazine ("but don't believe everything you read" :^).

Can someone who has actually opened their production model TT or someone from Atari who is clear of the situation, please comment? Thanks.

In article <1991May18.024738.571@daffy.cs.wisc.edu>, carter@cat23.cs.wisc.edu (Gregory Carter) says:
>I think Atari will survive if they gradually enable their machines to run
>MAC software at least more easily, so Dave doesn't have to work so hard :).
>The MEGA STE with the LAN ports for AppleTalk sure helps
>
I disagree totally. Why should someone buy an Atari when he really wants to run MAC software. Atari will only survive, if their own operating system can compete. With things like FSMGDOS and a multitasking TOS in development.. Don't forget: TOS is 32 bit clean NOW, and you can easily run TOS software on a 16MB machine.This is really nice for image processing and DTP.

>I can tell everyone right now. They only reason why I bought an atari was:
>
>1) Turbo C 2.0 (I have several personal projects going)
>2) Mac Emulation (Which takes care of the serious side of computing)
>
>Thats its. I HATE ST application software, except for Turbo C, probably the
>most ingenious piece of software I have seen for the ST.
>
I like Turbo C, too. But it's just an absolutely normal GEM application, just a SciGraph, Gemini, Rufus, Interface, Script and many other fine GEM based programs.

>GEM, God, did anybody preview what kind of REAL DOG MULTI-GEM is? Atari
>I HOPE will look elsewhere, you people REALLY don't want this, I would take
>a UNIX command line over MULTI GEM! Hopefully atari will be realistic and
>go the UNIX/MOTIF route.
>
What's the problem with Multi-GEM?

>GEM is brain dead, it never will amount to anything. I wish I could reclaim
>my ROM space IMMEDIATELY.

If you say things like that, you have to give reasons. Comparing GEM with Windows or Motif, there are a lot of good things both VDI and AES, and it will someday more than one GEM program at once, I see no problems at all.

Note: as far as I know, with Motif you simpla don't have a _virtual_ device concept: you simply can NOT redirect screen output to metafiles or printers.

>
>THANK GOD for Dave Small. I would kiss his hiney if he was here, as I finally

>fonts.

The program Fontz! by (the now defunct) Neocept can convert Mac fonts (amongst many other formats) to GDOS fonts. I haven't worked too much with this program, but the general idea is that you load the font into Fontz!, select the resolution you want for the GDOS font, and then use a pixel editor to touch up the rough spots caused by the resolution conversion. It's better than starting from scratch, but it ain't trivial either.

One place I know you can get Fontz! is from B+C Computervisions in Santa Clara, California (408)749-1003.

I am not associated with Neocept or B+C in any way etc. etc. blah blah blah.

I am upgrading to a PC, so I no longer need the following stuff

ATARI 520ST original computer, with no internal drive
TOS in ROMS. Also available is TOS on diskette. Includes
external single sided drive. Works perfectly. Includes
basic software to get you started, like word processor, terminal
program and stuff.

Price: Please Make Offer

ATARI SC1224 Color Monitor. Has perfect picture and in very good
condition. No sound.

Price: Please Make Offer

Also available is a power supply for an ATARI external disk drive

All items WILL be sold.

Thanks

Saurabh

Todd Drga asked about using Mac fonts on an ST...

It's entirely possible to convert Mac fonts to use in GDOS applications, but it's not a trivial task, nor is it particularly easy to do.

The program I've used is FONTZ, a commercial product of Neocept, Inc. It will convert several different types of fonts into GDOS compatible fonts, includin Mac and Amiga. It works well, and allows you to touch up the converted fonts and even design your own original fonts.

The sticky part is getting the fonts into the ST in the first place.

My solutions involved using not only the ST, but a Magic Sac Mac emulator and pc-ditto, the IBM emulator.

Most Mac fonts are available in various point sizes. However, they are usually appended to one another in one large font file. FONTZ will only process the FIRST complete font set in such a group, and ignore the others. Usually this will be the tiniest point size, making it very difficult to scale the font to larger, more usable sizes.

The solution is to go into Mac emulation mode and use the FONT/DA MOVER to split up the font and save it as individual files, one for each different size of the font.

This will also take care of the problem of unarchiving the fonts, as you can run STUFFIT to unstuff or unpack the font in Mac mode.

Then you're faced with getting the font onto an ST readable disk. This can be accomplished by using the TRANSVERTER program to convert the files onto ST disks.

If you don't have a Mac emulator, your options are very limited. Most Mac fonts are either STUFFed or PAKed. Unfortunately, as far as I know there is only an UNPIT program for the ST, no unSTUFFers. If the file you want to try converting is STUFFed, you can run the IBM emulator, pc-ditto, and use a PC utility that will unSTUFF the files onto ST readable disks directly.

Again, FONTZ will only convert the first font, if there are more than one font sizes in the file.

Another solution would be to have a Mac owning friend split the fonts up and modem the files to you.

And lastly, most Mac fonts are Shareware, not Public Domain.

It's a lot of work, but it can be worth it..!

Autodesk is, as far as I know, the biggest seller of CAD products
in the computer industry. At least they have the largest number
of unit sales. They dominate the MS-DOS world. Their products
include AutoCAD, and now the Generic CAD line as well. Of course,
if you *really* want to be on the cutting edge and the "top stuff"
in the industry, it's not really AutoCAD at all. The top stuff
is all running on Silicon Graphics Iris Workstations. That's what
the car manufacturers use (companies like GM, Volvo, I think Mercedes-Benz,
Honda too), Braun, and of course the major part of the 3D animation
production as well. But that's digressing. . . .

Ok. So now we know that STart may be gone from the North America scene, and what's left is pretty much just a couple of "fanzine" things. We'll hope that this improves. . . .

Can someone in Great Britain please clarify what's going on across the great puddle? I guess the first question I have is what is exactly the situation with "ST World"? Are they really trying for a come-back? I thought the whole thing was sold to "ST User"? If so, will they be accepting submissions for publication? Is there a mailing address?

I always thought of "ST Format" as a games magazine, but I bought the May '91 issue and it has coverage of desktop publishing and the monthly disk has a bunch of programming utilities (admittedly nothing new). That looks promising.

What's "ST User" been like lately? I haven't even seen it around for about a half a year now, so I'm wary about sending anything to them.

Hello again Netland,

I would like to compile a list of Mail-Order houses and dealers
that support the ST with software and/or hardware.
Please email me your favorite suppliers name, phone #, and
what they sell (i.e. software/hardware). Dealers and Mail-Order
places reading this should mail me also. I don't want to list
products, just company names so that we can all reference some
sort of list. PLEASE MAKE SURE YOUR INFORMATION IS ACCURATE!!!
I DON'T HAVE THE TIME TO VERIFY WHAT YOU MAIL ME. All I am going
to do is compile the list. In about 2 weeks when I think I've
got enough companies listed, I will post it to this group.

This means you! Get your favorite dealers name and number out
and mail it to me.

Thanks for your time and I hope this will be useful for others
too!!!

I think TOS error #35 means that the file is corrupted. You should
obtain a new copy of the program. At least, that's what I do when I get this
error.

```
Front Range ATARI Users Group June Meeting anonucement
Date: June 12 (Wensday)
Time: 7 PM
Place: RUN PC -- 524 W. Laurel, #2 ( North of Allison Hall, West of the Junction)
Topic:
Scanner for the ATARI
All are welcome to joint the meeting.
** Note we now have a new meeting location ***
```

4222. 4 sale

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 06:27:30 UTC
From: ykidron@isis.cs.du.edu
Message-ID: <1991May22.062730.4879@mnemosyne.cs.du.edu>
Source record: 231877

A complete Atari ST system for sale:

An upgraded 520 ST (1 meg), Tos 1.0 in Rom (20/11/85)
1 Double Sided, 1 Single Sided drives,
PS3000 color monitor (same as sc1224, with built in drive),
SM124 mono monitor,
MegaFile 30 (6 months old) Hard disk,
A new mouse (280 dpi),
Tons of software, either pd or original commercials.

$1500 or best offer.

Note: The owner lives in Israel, shipping not included. All hardware and
software are in EXCELLENT condition, HD brand new.

If interested please email to:

s2886663@t2.technion.ac.il
(Yaron Kidron).

4224. Atari Ads

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 07:55:32 UTC
From: pv@polari.UUCP
Message-ID: <4176@polari.UUCP>
Source record: 231764

Many often note the visable dirth of Atari advertising in the US.
Although I had heard that the TV show "Flash" was paid to feature Atari
computers with wonderfull graphics, I was unable to identify any machine
I saw in months of watching. Some might take encouragement from a full
page ad featured prominantly in the latest issue of MIX Magazine
(premere pro-audio and recording) where equipment is geared toward
professional musicians and recording engineers/producers. The machine
was appropriately the TT. Although too high priced for most musicians,
those who would spend 10 - 50 thousand dollars on digital editing
systems would find the machine and the software run on it very
competitive in that market.

4225. Latest Atari hard disk formatter/partitioner?

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 09:53:21 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <5186@syma.sussex.ac.uk>
Source record: 231887

What is the latest version of Atari's own hard disk formatter? I am about to buy a second-hand Atari Megafile 60, and would like to reformat it with up-to-date software. My current hard disk (SH205, same as a Megafile 20, I think) has been formatted with HDX301, which was written in Summer 89. Has there been anything since? Does anyone have strong feelings about whether a different formatter (Supra, ICD, GE-Soft, Claus Brod's driver, etc.) would be better?

I will be using the Megafile 60 with an early STE which probably has one of the - how shall I put this? - suboptimal DMA chips. Allegedly, these chips should work fine with Atari's own hard drives, but will probably cause other manufacturers' drives to lose characters in transmission. My STE is under warranty until July, so I intend to soak-test the drive then, if all is not well, send back the STE for chip replacement. According to a recent report, Atari UK are now are now willing to admit there was a problem with some batches of DMA chips and are readily replacing them for free.

Cheers,

Graham

ps. Thanks to all the people in the Southern & Western USA who acknowledged a previous posting. It's reassuring to know that our news feed is sending messages out as it should.

4226. Legal action against STrabble game.

Newsgroup: comp.sys.atari.st

In article <3601@hh.maus.de> Thomas_Quester@hh.maus.de (Thomas Quester) writes:
|
| We don't have SO many different incompatible LHarc-Versions, there only is
| one: the LHarc 0.6ss by John Webb. All other versions are compatible to
| the orignal (some including more features than the orginal).

So, where is this one available? Last night I came across a file I downloaded from atari.archive and all my versions of ST lharc would bomb on it. A common problem that I find is if an *.lzh archive contains a small uncompressed file (as does orbit.lzh) the Atari ST versions that I have blow up when testing/extracting the archive. As best as I remember I have lharc version 1.02 (from Unix), a few based on lharc 1.13c and one based on lharc 1.13b.

P.S. Our Unix versions accept the above mentioned file.

4229. virtual memory support on the TT

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 12:28:02 UTC
From: seimet@rhrk.uni-kl.de
Message-ID: <1991May22.122802.19270@rhrk.uni-kl.de>
Source record: 231882

Re: virtual memory management on the TT

As you are probably aware the TT because of its 68030 is capable
of virtual memory management. This applies not only for UNIX but
is also possible with TOS.
If you don't want your programs to interfere with software that
allows virtual memory in case of a buserror you have to test
if an error occured because of an invalid page or table descriptor
or if it is a "real" error which means that you can supply your
own buserr routine.
(Of course, programs which don't manipulate the buserr vector
don't have to worry about this.)

All future buserror handlers are recommended to look like
the following example:

```
------------------------------------------------------------

tst.b ttflg
beq nott ;makes no sense on an ST
ptestr #7,[16(sp)],#7 ;test descriptor
pmove psr,status ;get mmu status
btst #2,status
beq nott ;descriptor is valid-
jmp ([oldvec]) ;back to system exception handler
nott:
insert your own buserr handler here

------------------------------------------------------------
```

It is important that not only TT developpers use this kind of
handler. Software that is intended primarily for use on the ST
should use it to. Otherwise it won't be compatible to any future
virtual memory support on new machines.

Any more comments concerning programming on the TT? Go ahead!

```

4230. GemView (new version and some questions)

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 12:28:07 UTC
From: haacke@exunido.uucp
Message-ID: <3272@laura.UUCP>
Source record: 231881

Dieter have no permission to post articles to the News, so here is his message:

==========

Hi folks,

sorry but the program/accessory posted in comp.binaries.atari.st have a few
bugs or "unknown features".

I have write a newest version of GemView (1.0.4), but i must test something.
In some day i would to send it to the atari.archive; actually we have a
"ftp"-problem, so i can't do it. I think i will mail it to anyone who send
it to the atari.archive.

Since 1.0.3 (is in atari.archive):
- Correction of some mispelling.
- Better right-mouse-button support.
- GemView now works with a 4 bit color palette (Degas, Tiny and Spectrum).
- A color palette bug corrected (only seen on a TT; is there a bug on the TT
by using the color index 0(black) and/or 1(white) with vs_color() ???).
- The problem with uniterm is solved.
Since 1.0.4:
- If no window is available the accessory now exit with a warning.
- Better message handling with GEMINI.
- The main-(log)-window have a FULLER-button, which makes a very small and
smart window.
- And some __small__ changes and corrections.

What to do in the future:

- GemView could be faster (and smaller).
- A Big-GemView, which saves pictures in other formats (???)
- Transfer GEM-Metafiles into pixel-maps (and reverse ???)
- Saving installs.
- Continue work, if GemView runs as ACC and changing the main-application.
Therefor some questions: Should GemView automaticly opens its own windows,
if it found out that the runing main program is a gem-program (appl_init)?
Or should GemView wait for a handling with windows (wind_create/open)?
Should it ask the user for CANCEL the action, WAIT for new activition or
changing program or CONTINUE it's work and open the windows?
(!!! THIS WILL NOT IMPLEMENT IN THE NEXT SOME WEEK/MONTH !!!)
- A new color reduce algorithm. I have the followed idea:
A color is a point in a 3-dim-room (N^3). First calculate the distance
from each point to each other and save the nearest point with the distance.
Next searching the nearest neighbours and make this two point to one. The
new points is nearer to a point which represent more points then the

other. From the new point calculate the distance to all other points and
save the nearest (some other points must update, if the new point is nearer
as the nearest neighbour before). Then begin to search the nearest ....,
until we have reduce enough.
THAT IS AN ALGORITHM WHICH RUNS VERY SLOW: DOES ANYONE HAVE A BETTER IDEA?

Please let me now what do you think about the program, what you think is
to do in the feature (specialy how should GemView continue it's work) and
where are bugs.
!! I'm also interest in positiv reactions !!

Ciao (bye)
Dieter

P.S.: Actually i have not the time to make a lot for GemView.
P.P.S.: I hope anyone have understand my bad english.

4231. C++ on the ST

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 12:51:12 UTC
From: johnson@dover.dab.ge.com
Message-ID: <1991May22.125112.2812@ge-dab.GE.COM>
Source record: 231879

Greetings...

I'm trying to find a C++ compiler for the Atari ST. I have a 1040 with 4 meg of memory and two DS floppies. I do not have a hard drive at this time, but I plan on getting one at some point.

Does anyone know of a decent commercial C++ compiler for the ST? If not, does anyone know how to get G++ for the ST without having to recompile the whole mess? I don't want to attempt to recompile G++ without a hard drive, but I'm hoping that I can use it with the dual DS floppies and 4 meg. I would need the executables, libraries, and docs (including those for the debugger and whatever support stuff is necessary).

Is this stuff available anywhere? I do not really have FTP access, just e-mail. Thanks for any and all help.

|> Is there a mailing address?

Database PUblications is now Europress (or something like that). ST WORLD
was `bundled' with ST USER last month. I presume this is going to continue...
I'd never ead ST WORLD before, and thought it was a bit thin. But then again,
take all the games out of USER and it would probably be just as thin... :-)

|> [more stuff deleted..]
|> What's "ST User" been like lately? I haven't even seen it

Ever since they changed the staff at ST USER, I've cringed at the atrocious
teenage slang they use in place of English, right? (:-)) Still, I continue
to subscribe. Probably for the Ads, if nothing else. However, with the new
ownership, I think the staff list has changed again. Perhaps better English
from now on??

4235. Be careful with Sideline Software!

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 15:07:10 UTC
From: whitcomb@aurs01.uucp
Message-ID: <59868@aurs01.UUCP>
Source record: 231883

Just a heads up for those of you who are thinking of ordering
games from Sideline Software...

They just pulled a classic "bait and switch" on me. I ordered
some games advertised in the May "Current Notes", and when
I got the order one of the games was priced $12 higher than
advertised on my invoice, and one game had been omitted from
the order with no explanation. (To be complete, one game was also
priced a dollar less than advertised.) When I called to
question them, I was told it was an old ad... the magazine had
just come out that week!

In Sideline's defense, service is quick and prices are usually
very low, and I've always gotten good, complete working software,
but now I'm going to be very careful if I deal with
them in the future. Don't assume that the current price is
what you read in their ads, and don't assume you're going to
get everything you order.

4238. STE Problems

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 15:53:07 UTC
From: <>
Message-ID: <1991May22.155307.10320@infonode.ingr.com>
Source record: 231886

Last Night my newly purchased 1040STe finally showed up (after being backordered for eight weeks.) I carefully took it out of the package, disconnected my 1040ST, reconnected the STe and booted the system. the result was 2 (count'em two) system "bombs". I checked everything To make the story of a frustrating night shorter, if the hard drive was turned on, the system wouldn't boot.

I used the backdoor method of spinning the disk up after system boot. (Sometimes the HardDrive [Supra 20M] would spin up properly, sometimes not The Red Busy Light that would not Turn Off). After using the hard drive program and reinstalling the the disk icon, I could look at files however attempting to delete the auto folder on the C drive would lock up the system.

I tried to build a new temporary boot disk, but I found that deleting files or copying file would not survive the next disk refresh.

So the problem is that the STe won't write to disk's properly or boot properly.

Is this a new incompatibility between the ST and STe? ;-)

I thought that the hard drive might have gotten screwwed up, so I swapped the STe out and the ST in. [I wanted to play with the new software as well.} Every thing seemed to work just fine.

Any commment: Should I send the stuff back to the dealer and wait another 8 weeks for another machine. Is it likly that the chips having been seated properly.

Sorry about the header: I'm still trying to figure this new newsreader options out, [The defaults to xrn are screwed up]

4239. PC Ditto ? -or- PC Emulation on the ST

From: SYSPMZT@gecrdvm1.crd.ge.com
Message-ID: <91142.115339SYSPMZT@GECRDVM1.BITNET>
Source record: 231757

Pardon my ignorance, but... I understand there is an IBM PC emulation package (hardware or software) available to run on the ST. I have an old (TOS 1.0) 1040 ST that I'm thinking of dedicating to a PC, as I've just bought a new 1040 STe. I need the compatability to my and my girlfriend's workplaces, and this could be cheaper than buying a clone. I also get the potential of running ST stuff on that machine when I want to.

Does anyone have any experience with PC emulation on the ST? Is it fully compatible with the MS-DOS world, and does it work on early levels of TOS? Any disk compatability problems (I understand early TOS would not add a 3 byte identifier to DOS disks) and/or software solutions? Approximate cost range, and a good place to purchase it? Did I dream that this capability exists?

Thanks for any and all information and suggestions.

Phil Z

Those who have the Magnavox ST-compatible monitor have
the sound running on a separate RCA jack. This can
easily hook to a stereo thru a y-adaptor; while not
IN-stereo, it comes out thru the stereo, and sounds
terrific! Not quite an Amiga, but good nonetheless.
The music at the start of the game BAAL is the best
I've heard; the guitar sounds very real.

I imagine another cable could be built for use with the
SC1224 Atari monitor, that has a separate sound jack; but
you'd have to get inside the monitor to hook it up.

I felt that you did a really good job on the colour reduction
algorythm. The colour selection seems better than on a couple of
other programs I've been using ("VDI_GIF" and another one I can't

remember offhand). I've been kicking around ideas for colour reduction codes for a while now and I haven't gotten around to writing one yet, but it seemed to me that it might be easier to work in a 2D framework based on Hue and Intensity, which is the way a television signal works. But to do this you have to start by converting the palette from RGB's for most picture format, then do the calculations, and then re-convert to the target palette style (Atari in this case).

Working from Hue and Intensity, I think you could give preference to one or the other for your colour assignments, as an option for the user. That is to say you could allow the user to chose whether colour assignments are weighted to give the maximum detail in terms of the hues (which could result in a pastel, low contrast image with a lot of detail in terms of colours) or maximum detail in terms of contrast (which might result in a picture with fewer colours, but more shading).

Again, I'll emphasize that I haven't gotten around to writing this code yet so I don't know if it's going to work out the way I'm expecting it to.

4245. Probs with RCS5AP1

Newsgroup: comp.sys.atari.st
Date: 1991-05-22 20:30:00 UTC
From: Mick_Schmidt@hb.maus.de
Message-ID: <61856@hb.maus.de>
Source record: 231783

Why me! ;-)

Why do I have have problems with almost every gnu program?

gcc doesn't want to find the standard include files although GCCINC and GCCLIB are properly set and now I want to use RCS and it doesn't work either.

When use ci for the first time everything works great, the file is checked in (into the ,v file in the RCS folder) and deleted. The co works also, but when I change the file now and want to check the new revision in ci aborts with an diff error. This behaviour I get under TOS and MinT, but when using MinT the error msg is more specific, it seems that the output form diff is not what ci expects, because what diff says only that the two input files (filexx and e:\tmp\xxxxx) differ. The same result that I get, when I call diff with only two filenames, but without any other parameters (like -ae, etc.).

So what am I doing wrong this time?
I've all the rcs binaries in my bin folder which is in my PATH, also I have USER and TMP properly set (TMP without a trailing backslash) and PWD isn't set at all.

Any ideas? somebody? The class? ... ;-)

Source record: 231897

Hi,

Well on the network a while back I put out a plea for information on
soundtrackers for the ST.And I thought I would post my conclusions..

So far I have the following soundtrackers,if you know of any more then
please let me know...

TCB soundtracker demo - quite good but only demo,advanced features
missing like MIDI.

ESION I tracker - pretty good,comes in two forms,one for the ST
and one for the STe,sound is very good compared
too some,has some nice features.

Noisetracker - By Dr.Satan V1.5 , very good soundtracker for
ST,no STe support as yet.Looks and feels like
an Amiga noisetracker,some features missing
Still no MIDI support... Supports external sound
cartridges like STReplay,ProSound and the MV16
cartridge given away with B.A.T.,nice feature.

Digicomposer - Improved version of the previous,with STe
support and Stereo support for St's with
external cartrigdes.extra features very nice
For me this is the best of the lot,but does
have some bugs,like not treating drive B
correctly and sound glitchs when changing params
of output device.

NOTE:- this are in the order of WORST to BEST in MY opinion and only my opinion.

but unfortunately none of them seem to support MIDI at all,and most die when
my MIDI keyboard is powered up???? DO any support MIDI as an Input device??

any way just thought you'd like to know....

Alan Messer.

4248. Rainbow TOS Bombs again

I have recently installed the new? rainbow TOS in my mega2.

flameon
It seems to run less software than the old version, which
is depressing since the my older 1040 which I sold for the Mega
ran the largest set of software.

Well is it my imagination???

Is there a solution to all this bombing?
flame off
And can I speed this slow poke up?

thx,

freds@hpspdra.hp.com

Message-ID: <1991May23.032656.10546@actrix.gen.nz>
Source record: 231791

Get the DMA chip replaced, you could change to a better hard drive at a later date, from what I have read the faulty DMA chips are very unpredictable, some will work with a Atari drive, but otheres not.

The dealers here find that there are no good rules for testing for these chips, if it is tested on say a Atari drive in a shop, it could probably fail on a different Atari drive.

I would not like to be stuck with a machine that was a bit iffy

Note: the ICD booter will only work if you have a ICD host adapter in your system.

Not to minimize what's involved in putting out a magazine, AIM is not exactly in the league STart was trying to play in. I'd personally put it at about the level of professionalism Current Notes was at when it first hit national distribution. Perhaps it will follow the same upward path. But anyway, the press release that prompted this struck me as real real strange.
Steve

Digicomposer seems to have the worst sound of any of the Noisetracker players whereas Esion I has some of the best sound. Digicomposer on the other hand has more graphic bells and whistles, which I like, than Esion.

Oh, lemme add than Digicomposer seems to have the worst sound on an STe, at least mine. :^) I'm not sure about ST.

Calamus 1.09 writes directly to the port instead of using OS calls, so I suppose it will be very hard to redirect printer output to a file.

So there I was trying to sleep when it hit me at about 4:30 AM
that I was wrong. This *still* isn't a 2D system because you still
have to consider "Saturation". There doesn't seem to be any way
to reduce it to 2D. At least I don't think so. I still might
use Hue/Intensity/Saturation instead of RGB if I get around to
writing a conversion. No rush though. I have other things to
get to first.

>Your views ?

Spears are quite right to pursue this. I believe there is already a licensed version of Scrabble from a company called Leisure Genius. PD versions would be direct competition. I did not like the way the ST User article started with biased comments like how big Spears are and how they make lots of money and the PD library was a non-profit pauper of an organisation.

Bottom line. Spears have the copyright and if there is a demand for Scrabble in any shape or form then they have the last word on its distribution.

I have seen a PD version of Monopoly on the ST and have also heard of Parker Brothers pursuing similar cases of duplication.

For games that are not identical to the original, I suppose the 'look and feel' laws must creep onto the scene.

4260. Atari.archive monthly posting

Newsgroup: comp.sys.atari.st
Date: 1991-05-23 11:05:50 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991May23.110550.23902@terminator.cc.umich.edu>
Source record: 231752

Welcome to atari.archive.umich.edu

This is the monthly posting from the umich atari posse. We hope
it will answer some of those nagging questions that always seem to pop up
from time to time. If you have any additional suggestions, please mail
them to me, at weiner@atari.archive.umich.edu.

1: How do I use BART?
Now that BART is back on-line again, you can get bart help by mailing
atari@atari.archive.umich.edu and include the word 'help' in the body of
the message. This doesn't mean you have to send mail Jon or I.

2: How can I connect via FTP?
If you are interested in ftp, I recently wrote a beginner's guide. Please
mail me and I will send you a copy. I'll post it every once in a while too.

3: What if my machine doesn't support name service?
Two things to do here:1) Demand that your sys-admin install it soon,
and 2) use the internet address 141.211.164.8

4: I can't download because my hard drive doesn't work and my modem goes
out sometimes and .....HELP!!!
Sorry, outside of the archive I really can't help you....Your best bet is
to find someone at your site with a similar set-up, or post to c.s.a.st
for advice.

5: HEY! Your index is much better than it used to be!!!
HEY! I know! We've added text descriptions and a whole lot more! To top
that off, the index will now be updated instantaneously. No more waiting
for me to get off my butt and do it.... If you have noticed any errors,
or have any suggestions or descriptions of files
please mail them to me!!

6: When I try to FTP to the archive's host, I get a message saying that my
machine wasn't recognized and I wasn't allowed to log in. What's up?
We only accept ftp logins from recognized hosts. If you are not allowed
to log in, please try again. It is possible that the DNS took a bit too
long. If you are still denied access, ask your sys-admin to fix your
name servers.

7: Here's a question for you Jeff, how come I can't use 'ftp terminator.cc.etc'
any more to connect?
That's because you're not using atari.archive.umich.edu like we told you
to. In the near future, terminator.cc.umich.edu will change it's name.
Don't say we didn't warn you.......

There are a few files you'll really like to have:

archivers/arc602.arc : The latest version of arc
archivers/zoo.arc : The classic archive program
archivers/compress.zoo : Useful for removing .Z from sounds and binaries
archivers/unlzh11.arc : Unpacks .lzh files
archivers/sttar.arc : Removes those nasty .tar extenders
THEY ARE CONTAINED IN THE SELF EXTRACTING ARCHIVE starter.tos!!! PLEASE USE IT!

Thanks to everyone who has uploaded anything lately.....

Interesting things this month:
1. We will be posting the New0 fiel every week now. Hope you all love
this. This should eliminate the need to ftp overseas to check for new stuff.

2. I also put up a ls-lR.Z version of the index for anyone who wants it.
This will be updated periodically.

BART PROBLEMS:
Common Error for the month of May: BE SURE TO CHECK YOUR SPELLING!!!

PLEASE NOTE: FTP service is a privelege, not a right! Please make
a supreme effort to keep heavy FTP use in off-time hours (i.e. after
5 pm EST but before 8 am EST).

Any ideas, questions, comments, etc. to me,
weiner@atari.archive.umich.edu

--
Jeff Weiner --- weiner@{{sklyab,felix}.engin, atari.archive}.umich.edu

4261. How to upload to atari.archive or comp.{binaries,sources}.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-05-23 11:07:32 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991May23.110732.24078@terminator.cc.umich.edu>
Source record: 231753

```
Uploading to Atari.archive.umich.edu
and
Posting to comp.{binaries,sources}.atari.st
By Jeff Weiner, Atari.archive Guardian

How to upload to atari.archive.umich.edu:

There are two main ways to upload to the archive: FTP or mail

1: FTP - This is the preferred method, as it doesn't clog my mailbox with
megs and megs of stuff, not to mention it's a bit easier for you too.
Logon to the archive as usual, then issue the following commands

cd ~atari/new
type binary
put filename.ext
mail weiner@atari.archive.umich.edu .... "Hey Jeff, I just uploaded this..."

This last step is very important. As we're now integrating the
index with text and the ls -lR listing, descriptions and an address to
send questions to are key.

Ed Krimen, ekrimen@ecst.csuchico.edu, adds this:

For those that may not know, may I add that, for aesthetic effects,
if you enter "hash," before you "put filename.ext" or "get
filename.ext," the ftp program will display a # for every 1024 bytes
sent or received. Actually, when you 'put' a file, it will display
bunch of # at once. Moreover, if you enter "bell," it will sound your
system bell when a function has completed. Finally, you can send and
receive a list of files using the "mput" and "mget" commands,
respectively, with a list of the files after the command.

2: MAIL - This is a bit slower for you and for me, but is still very effective.
Simply uuencode the file, (please split it into parts ~=60 K or less please)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpfull as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled file transmission, containing a short description of
the file, etc. Shar files are also acceptable, but I prefer the uuencoded.

And for those of you who would like to see your binaries and sources appear
in comp.{binaries,sources}.atari.st, the following is taken from Steve
Grimm's Introduction to Binaries and Sources:

Subject: Submitting binaries for publication
```

Items intended for posting or queries and problem notes should be sent to atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator, Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist, atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and forward them to me. Submitting to him saves net bandwidth, so it's encouraged.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while.

Also, as of volume 8, I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this pretty much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to sun!ebay!panarthea!atari-sources. In Europe, send your submissions to Jan-Hinrich Fessel, the European submoderator of the group, at unido!atari-sources (or, if you're a masochist, atari-sources@unido.informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it

for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas' "uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

4262. FTP Beginner's Guide

Newsgroup: comp.sys.atari.st
Date: 1991-05-23 11:09:10 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991May23.110910.24217@terminator.cc.umich.edu>
Source record: 231754

This is a basic guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

~~~~~~
Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.
Also, if your machine doesn't allow you to specify the atari.archive name,
try using out internet address : 141.211.164.8 Then, march down to
your sys-admins office and ask him to install name-service. Your life will
become much easier.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
ls -C : Lists the files horizontally, instead of vertically.
ls -F : Lists filenames, but adds a / to the end of directory names.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
cd .. : Goes 'back up' a directory, to the one you came from.
~~~~~~

This from redmond@IUS4.IUS.CS.CMU.EDU:
For more than one argument to ls, use double quotes. Eg. ls "-FC *.lzh"

These are about all you need to get moving around the archive.

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer files. More often than not, you'll want to transfer the files from the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that you'll be transferring a binary file. This is really important. You'll waste a LOT of time if you download files that were not transferred in binary mode.
Third, issue this command 'get <filename.ext>'. This will instruct the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This tells our machine you're no longer interested in ftping files, and would like to go back to your command prompt.

Now, you'll need to download your files from your mainframe(sparc, whatever) to your ST. Usually you'll want to use either kermit or x- or y- or z-modem protocals. They're very reliable. I'd be quite hesitant to try something else. Also, your machine and ST are usually unique to you. This means that I really can't help you with this part. You could try asking, but I'm going to promise anything.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of. Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours, in our time zone. That would be 9 am to 5 pm , EST. This roughly means upload or download one file or so and little else during these hours. After 5pm, have a blast. Go nuts. We probably won't mind nearly as much..... Otherwise, we will drive to your campus or place of work (even if you live in Europe) and we'll kick youe butt. Or, Jon will sing Prince songs to you. Whichever you'd like the least.

2) If you have a question about some aspect of ftp service or some other area of your computer, please ask around at your site first. Don't immediately fire off all of your questions to us. I don't mind answering questions about the archive, problems with logging in, or something similar. But I tend to get upset when people ask me questions like, "Jeff, how come I can't get the fgrep command to work properly on my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I know it's not the greatest thing to do, but if you can find time to download stuff, I think you can find time to return the favor and upload things also.

If you have any reasonable questions, any comments or concerns, etc.
please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

|> Brod's driver, etc.) would be better?
|>

Hello Graham!
The latest version of HDX and AHDI is 4.0. I use it to format my MEGAFILE
and it works fine. The difference between 3.01 and 4.0 is, that the driver
will support SCSI-DMA on the TT. I copied it from the MEGA STE Harddisk-
Utility Disk.
The only other driver I know is CBHD from Claus Brod. The driver is good,
but it didn't support big GEM and extended partitions in the current
version :-(and I want one big partition.

Greetings, Olaf

4264. ST World (UK) (was Re: Publishers (II))

Newsgroup: comp.sys.atari.st
Date: 1991-05-23 13:36:29 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1991May23.133629.7264@newcastle.ac.uk>
Source record: 231766

In the editorial of the very thin ST World included free with ST User it states that ST World is being refloated as a monthly mag after a few issues when it is included free with ST User. This could be a great day for the ST as this magazine was from 1986 - 1990 a very nice non games magazine catering for the ST community. Perhaps this re-publication as a monthly is in line with Atari UK's aim at capturing more of the professional computing market.

Sound Quality is no problem, try to upload the program NT_COMP from atari.
archive. This program can compile the modules to VERY high quality compressed
samples. The Program can also play them on both st,ste and tt.

4268. TOS 1.4 bug?

Newsgroup: comp.sys.atari.st
Date: 1991-05-23 15:41:13 UTC
From: lincoln@cbnewsc.att.com
Message-ID: <1991May23.154113.24096@cbnewsc.att.com>
Source record: 231762

I've not seen anyone else describe this problem, but it started
for me after I installed TOS 1.4 on my 1040ST.

Every now and then when I double-click on a GEM application,
instead of running it, the desktop gives me the show/print/cancel
dialog box. When I click on cancel and double click on the
application again, it always runs normally the second time.
I haven't been able to detect any pattern as to when this
happens, but I'm reasonably certain it's not the result of
clicking on the wrong file. I would estimate it happens
5-10% of the time, and it can happen with any .PRG program
(I haven't noticed it with .TOS or .TTP programs).

Has anyone else observed this? Any solutions? If no one else
has encountered it, I'll start ripping stuff out of my auto
file to see if I can find the culprit.

> anyone a fast low-priced system...

I would have to echo this, last I heard a TT (whenever they get around to selling them) will be about $5000 with HD 4 MB etc. _I_ want a TT with _NO_ disk (I have a big disk already) and minimal ram. It will be cheaper if I plug in the simms rather than Atari. This will allow me to upgrade at a resonable price. If not then I guess I will buy a decstation 2000 at EDU discount instead (It will be cheaper).

The Point I would like to make is that the upgrade path for many existing users has unwarranted expense - not all TT buyers will be new customers and many will have HD's already.

4271. making a hookup for ST

Newsgroup: comp.sys.atari.st
Date: 1991-05-23 17:00:45 UTC
From: 9020675@ul.ie
Message-ID: <17473.283bf53d@ul.ie>
Source record: 231905

On the subject of hooking up to a stereo, I made a cable for my C=64 some years back so that I could go from the 5 pin monitor socket to a stereo. All you needed wa plugs, a soldering iron and a layout of the pins.

Is it possible to do the same through the ST monitor port. Could you wire a plug for that port from the sound pins to a cable ????

Although not stereo, I hooked my C=64 up and sound from games like Sahdowfire, Frankie goes to Hollywood etc were unbelievable from a commodore 64.

Recently I hooked up a sega megadrive to a sony stereo - 3 channel speakers, 80 watts of power each - Wow. Games like shinobi,Ghostbusters,shadow dancer, Strider - I was speechless.

>with the TT-RAM requiring a daughterboard. Moreover, Atari does not
>sell this daughterboard separately. So the only way to get TT-RAM is
>if the machine is shipped with at least 2megs of TT-RAM from the factory,
>and then, I suppose, more TT-RAM can be plugged in later.

This is wrong. The daughterboards for Video and Fastram are sold
seperately, at least in Canada. The boards contain a memory controller
which is necessary for the TT to access the extra ram.

Message-ID: <1991May23.205134.25569@doc.ic.ac.uk>
Source record: 231785

Hi,

Does anyone else out there own BAT??? And if so how far have you got?
I don't seem to be able to get very far!!

So far I have pretty much explored the city,but I getting get passed the guard to the DRAG,I also can't get through those doors that lead to the engines for something like that... When asking about the Baddies around town I get the chance of a meeting but nothing much ever seems to come of it???

Can anyone help???

ALSO,does anyone know how to program the sound cartrigde that comes with BAT, called the MV16,it is evidently possible as Dr.Satan's Noisetracker can do it? As far as I can see,it seems to be Two 8-way multiplexed D to A's thus giving 16 channel mono 8-bit sound... <does this help??>

and finally are there any other sound cartridges like this,I heard something about a MT-16 somewhere???

Thanks in advance,

Alan Messer.

I think that MiGraph's SuperCharger has a facility for this. I'm pretty sure it only dumps .IMG files, but it's a start. SuperCharger used to be an add-on product for EasyDraw, but now comes included with the SuperCharged version of EasyDraw. Hope this helps.

Shouldn't. Using a NULL pointer as raster adress means `I want the VDI screen buffer and nothing else'. Clearly, the physical screen is ALWAYS in device specific format.

I bought mine in 1988 when the TOS was 1.4. The sales talk says it runs most
of the famous programs.
> Any disk compatability problems (I understand early TOS would not add a
> 3 byte identifier to DOS disks) and/or software solutions? Approximate
It comes with a formatter, because it assumes that a 5.25" double sided
double density 40-cylinder drive (360K, not 720K) is the standard media.
> cost range, and a good place to purchase it? Did I dream that this capability
> exists?
I want to sell them to anyone. The reason is that the MSDOS we use here has
almost nothing to do with the American version (I didn't expect PC Ditto to
print Japanese characters on ST's screen) and therefore unusable except
for copying files, which primarily does not require an emulator.
>
> Thanks for any and all information and suggestions.
>
> Phil Z

For sale:
pc-ditto by Avant-Guarde Systems. Euro version (for UK?). The user registration
card yet to be filled. The program itself is in a 3.5" diskette. Eidersoft,
a London vendor, has attached a 'IBM FORMAT SOFTWARE'.
Asking Yen 5,000 or US$35.oo including postage by air.

A 80/40 track 5.25" floppy drive for immediate use for ATARI ST. (240 Volt
power supply is assumed) You will have to fix the power supply if you are
outside UK (using a 5 and 12 DC volt power supply or a transformer).
Asking Yen 10,000 or US$75 including surface mail postage (I could
remove the 240V to 8V transformer inside to make it less heavy).

Originally bought from PowerComputing in England.

If you are interesed, please email to
ytsuji@cfi.waseda.ac.jp or
YTSUJI AT JPNWS00 (bitnet)

The point of my argument was that you were refering to all IBM's as MS-DOS machines. While that is true for the most part, a lot of IBM users (like myself) wouldn't hear of using MS-DOS.

I had the misfortune of buing a PC Ditto board for my ST-- not only
didn't the thing fit in my 1040's case, but even attached without a case, the
thing simply wouldn't work. Since Avante-Garde has apparently gone out of
business, I doubt I'll ever get the worthless thing running.

You may consider simply buying a real PC cone-- they're very cheap,
and since Intel lost a copyright suit, we can look forward to some price
wars over 386s and 486s. Even if you get the Supercharger (an IBM emulator
I've heard lots of good things about), you're still tied to the ST-- and
upgrade boards and stuff might not always be supported.

Get version 1.0.4. It sounds like you have TOS 1.0, which the old versions
didn't work on. I had a couple of people tell me that they couldn't get
it to work with TOS 1.0.

>file to see if I can find the culprit.

This was one of the noted bugs in TOS 1.6 when the STe came out. This is the first time I've heard about it on TOS 1.4. People suspected that this was caused using an old DESKTOP.INF with the new TOS. This hasn't worked because this bug occurred for me several times when I ran GEM-View as a program. The theory in the beginning was that this bug was caused when an application with a short filename was executed; however, GEMVIEW.PRG isn't short.

Also, an almost assured way to crash TOS 1.6:

1. At the desktop, set up a directory window showing the files in text mode; resize the window so that only the filename and size are showing. Position this window on the left side of the screen.

2. Select a text file and SHOW it. Use the right mouse button to exit, and hold it down when the computer redraws the desktop.

3. While the desktop is redrawing the scroll bar for the directory window, it seems that it gets confused with it and the right mouse button, which just happens to be on top of the scroll bar.

I haven't done this in a while. You may have to move the mouse while holding down the right mouse button to get it to crash. Actually, I think it may reboot.

So if all they want to produce is a wimpy piece of junk version, then that's
all anyone can have? If that's right, then I feel strangled.

>For games that are not identical to the original, I suppose the 'look and feel'
>laws must creep onto the scene.

As I posted, STrabble is very different from Scrabble the board game. If it
is copying the Scrabble programs (eg. Leisure Genius') that is the problem,
then every PD author is in trouble (esp. Shareware):

* Hackman is better than any Pacman I've seen.
* Cooltetris is better than any Tetris I've seen.

I think PD authors (and Shareware authors - it's almost the same thing - but
don't argue it) should be free to write whatever programs they want.

4288. Upgrading a single sided st

Newsgroup: comp.sys.atari.st
Date: 1991-05-24 01:54:22 UTC
From: s902156@minyos.xx.rmit.oz.au
Message-ID: <1991May24.015422.23817@minyos.xx.rmit.oz.au>
Source record: 231786

This is my first posting to this group.. hope it works 8-)

A friend of mine is one of those poor souls with a single sided drive in his
520 st. He bought another drive (which we tested on an IBM and was fine)
But we can't get it to work in his ST! There is a little board on the back
of the original board which we found to be neccesary.. don't know what for though.. just
that it doesn't work without it in there.
The new drive WORKS! It just doesn't use the second side!
Is there a nice simple fix like setting a jumper on the mother board?
(I don't know much about it, but it looks older than mine and has
room for sockets for extra ram)

This can"t be such a hard thing to get working!! Please help.

>Can't have competition can we!

Competition. Of course! But think up your own idea. There are plenty of word
games that are not like Scrabble. Parker Bros. Probe comes to mind.

>>I did not like the way the ST User article started
>>with biased comments like how big Spears are and how they make lots of money
>>and the PD library was a non-profit pauper of an organisation.
>
>Why not?

Because the biased reporting quite clearly showed where ST Abusers sympathy
was and wanted you, the gentle reader, to feel the same.

>>Bottom line. Spears have the copyright and if there is a demand for Scrabble
>>in any shape or form then they have the last word on its distribution.
>
>So if all they want to produce is a wimpy piece of junk version, then that's
>all anyone can have? If that's right, then I feel strangled.

Have you seen the Leisure Genius version? Is it wimpy?
I'm sorry if you feel strangled but the law is the law. If you invented the
original game I suppose you'd be encouraging everyone to clone it.

>>For games that are not identical to the original, I suppose the 'look and
>>feel' laws must creep onto the scene.

Way back in the old days, Atari used to shoot the head of anyone who produced
a Pacman lookalike. They did this mainly to non-Atari software houses. Since
the split of Atari Games and Computer companies they have been less forceful.
I'm surprised Dave gets off with Hacman 2.

>I think PD authors (and Shareware authors - it's almost the same thing - but
>don't argue it) should be free to write whatever programs they want.

It would be nice but as stated earlier, by others, if PD stuff competed really strongly with commercial products then companies would go out of business.

Fontkit Plus V3 will convert Mac fonts to GEM fonts (though I haven't tried it). Fontkit Plus is a great package for editing bit-map fonts. I've used it for creating screen fonts for use with Fleet Street Publisher 3. It will also convert Calamus fonts.

It's available from the ST Club in England. Cost is about 19.95 pounds. If you want the address, e-mail me and I'll find it.

I've written a small GEM program with icons and windows.
When I close a window (handle > 0), how do I get a redraw
message for window 0 (desktop bg) to force a redraw of
part of other windows and icons?

And I have another problem, when using DEGADESK. Switching
on a bg picture overwrites all my icons on the screen.
(May be the same problem)

What is it with WF_NEWDESK ? (I tried out but saw no effect)

Any help would be useful

In article <1991May23.133629.7264@newcastle.ac.uk> D.C.Halliday@newcastle.ac.uk (Dave Halliday) writes:

In the editorial of the very thin ST World included free with ST User it states that ST World is being refloated as a monthly mag after a few issues when it is included free with ST User. This could be a great day for the ST as this magazine was from 1986 - 1990 a very nice non games magazine catering for the ST community. Perhaps this re-publication as a monthly is in line with Atari UK's aim at capturing more of the professional computing market.

Dave H
(D.C.Halliday@newcastle.ac.uk)

I wholeheartdly support the re-float of ST World, but I refuse to buy ST User to get it. My reason is this. I once had a subscription to a good mag called ST User which had a fairly good mix of Hardware, Progging and Games etc. However one day about a year ago they started a 'new look', which I find not only less appealing but downright insulting. I am not a 16 year old hacker games player and object to the comment style in the magazine. In the letters section they fail to take anything seriously and the rest of the magazine is not much better. At least ST World always treated its readers as though they had an IQ above 6.

ST World itself isn't published by Atari UK, its not published by Europress (aka Europa publishing). If they re-launch it as a standalone mag with the format they established in the quarterly segment of their history (2 issues) and encourage serious advertisers in there then I'm all for it.

Well I did not get see the last issue of ST-World (April), the importer
here lost the entire Air Shipment of magazines, the last one we got here
was in December 1990. but that was of the 1/4 issues.
Are you stating that its gone back to a mouthly issue ?,
and was the April ST-World combined with the ST-User for that month ?.

I have just written to my sister to see if she can get me the missing issue,

>Can't have competition can we!

Well, sure you can. If you want to compete, you come up
with your own game. It's the same as "competition" in the book
writing field. Nobody is stopping you from writing your own
book. You just can't photocopy Arthur C. Clarke's latest book
and sell the copies to other people, and you can't just change
the names of the characters and claim it's yours or take similar
short cuts. You have to "write your own book." Hundreds of
writers do it every year.

Here in Germany you can get a TT equipped with 8MB RAM, a TTM194 and a
nice quantum drive (52 mb) for ~6500 DM. Most dealers sell you TT's with
any SCSI drive they have.

From: wilsona@dcs.glasgow.ac.uk
Message-ID: <1991May24.144308.8344@dcs.glasgow.ac.uk>
Source record: 231904
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The easiest way to get stuff from a Nac is to format a DOS disc on an FDHD equipped mac (all of the later ones), and simply copy the fonts onto it. Stick the disc in an atari and run 'mac2gem' from (wait for it...) the ST Club on it. Easy. No problem. If you do not have access to a Mac then it is a problem. There is some PD stuff on terminator. A non FDHD Mac involves connecting the computers together. Note: Format the MS-DOS disc using 'Apple File Exchange'.

Alan Wilson (No relation to anybody connected with the ST Club...)

4302. Software Compatibility Poll

Newsgroup: comp.sys.atari.st
Date: 1991-05-24 18:24:09 UTC
From: whitcomb@aurs01.uucp
Message-ID: <59873@aurs01.UUCP>
Source record: 231910

Hullo, folks!

I have long been frustrated that I haven't been able to find a good list of software that works or doesn't work on this version or that version of TOS. I have been considering upgrading to a new machine, but I want to know which programs will be able to jump platforms with me.

Therefore, I am going to attempt to compile a list of ST/TT software that Net readers have had experiences with on different platforms. I will post the results.

Please cut out the form at the bottom of this posting and return it to me filled in with data about specific ST/TT software that you know works or doesn't work on various Atari computers.

I want to try to limit the scope of entries so that this doesn't get out of hand. It probably won't do many people much good to know that you have 47 games that all run on TOS V1.0. It would be useful to list the 16 of these that don't run on the STE. I'm not really interested in old programs that aren't available any more, or programs you don't use. I especially don't want information about programs that you cannot _personally_ verify will run or not run on the systems you specify. Don't quote from friends or magazine articles. I want _your_ experiences.

In order to make the list as simple and managable as possible, I need the following information on each program:

Title/Version: This field should contain the title of the program, and the version number or release date. Use a slash character to separate the title and version. I only want one version per title... use the most recent one you have.

Type: I want to give a broad classification to each program, followed by a code indicating if the program is commercial or not. The classifications should use the following codes:

acc: Desk Accessory
env: Environment (command shells, alternate desktops, emulators)
game: Gender Altering Mind Envelope...er...Game.
grph: Graphics (art, drawing, CAD)
midi: Midi (Sequencer, Notation, Patch Editor)
text: Word processor, DTP, database, etc.
util: Utility
app: Application (none of the above)

Compatibility/Incompatibility: Indicate which version of TOS you
have noted compatibility or incompatibility with. Use
these letter codes for each:

A: TOS V1.0
B: TOS V1.2 ("Mega TOS")
C: TOS V1.4 ("Rainbow TOS")
D: TOS V1.6 (1040 STE)
E: TOS V2.nn (Mega STE)
F: TOS V3.nn (TT) All resolutions
G: TOS V3.nn (TT) ST resolutions only

Examples:

Title/version Type Compat Incompat
==========
Wowterm/2h app A,D
Spud Writer Professional/(10-89) text B,D E
Daily Fat Intake Counter acc B C
Speedzotz 1000 game B D
NoiseGronker/4.6 midi A,B D,E,F,G

I know these codes are cryptic, but I anticipate a large response,
and I'd like to be able to manage the data. I will sort out
the data and try to make a more presentable report later.

Please e-mail responses to me using this form:

>>CUT HERE<<

TYPE COMPATIBILITY CODE
==== ==========
acc: Desk Accessory A: TOS V1.0 ("TOS Classic")
env: Environment B: TOS V1.2 ("Mega TOS")
game: Game C: TOS V1.4 ("Rainbow TOS")
grph: Graphics D: TOS V1.6 (1040 STE)
midi: Midi E: TOS V2.nn (Mega STE)
text: Text F: TOS V3.nn (TT) TT resolutions
util: Utility G: TOS V3.nn (TT) ST resolutions
app: Application

LEAVE FIELDS BLANK IF YOU DON'T *KNOW* THE ANSWER!!

Title/version Type Compat Incompat

At least in TOS 1.6, this happens with files that have an 18 character path name, I think. I only get it for E:\MWC\BIN\MSH.PRG... You can very nearly eliminate it (if not entirely) by changing names that happen to be that length.

Pretty annoying. I have yet to hear any comments from Atari on it so I don't believe it's been fixed in later TOSses.

Well, from the mail I received it seems 10 people on this net purchase
their software and everyone else either uses public domain software
or pirates their software. I know that's not true, but I was expecting
everyone to submit at least 1 favorite dealer to add to this list. It
benefits everyone, please email or post your favorite dealer. Thank you!
This will be the last time I post for names.

Below is the original post:

Hello again Netland,

I would like to compile a list of Mail-Order houses and dealers
that support the ST with software and/or hardware.
Please email me your favorite suppliers name, phone #, and
what they sell (i.e. software/hardware). Dealers and Mail-Order
places reading this should mail me also. I don't want to list
products, just company names so that we can all reference some
sort of list. PLEASE MAKE SURE YOUR INFORMATION IS ACCURATE!!!
I DON'T HAVE THE TIME TO VERIFY WHAT YOU MAIL ME. All I am going
to do is compile the list. In about 2 weeks when I think I've
got enough companies listed, I will post it to this group.

This means you! Get your favorite dealers name and number out
and mail it to me.

Thanks for your time and I hope this will be useful for others
too!!!

I have been considering several peoples' offer for atari 540 ST computer system
s.. (With a monitor and mouse).. I do have question, however, before I actual
ly buy one.. -
1) How is the graphics? I am a mini-man.. I never owned a computer that did
graphics.. (except VT100 linedraw and Tektronics TekGraphics). What is the s
resolution? What is the color capibilities? How easy is to program graphics
via computer programs that I'd write?
2) Is there a CAD system available for Atari ST units? How GOOD is it?
Will it support a line-Plotter?
3) How good is the mouse system on the unit? Is a shitty piece of plastic,
or is it a precision unit.. (Is it better than macintosh mice?)
4) How available is software? Is it expensive? Is is widly pirated?
5) What storage devices are available? Is there a floppy drive built in?
What is its capacity? Is it fast (For a floppy. I'm not asking for a
Jesus box.. just a pretty fast floppy)..
6)Is there telecommunications available for the unit? Is there a serial port
on the Unit? Would I be able to Network it to my Minicomputer network?
7) Finally, is $400 a good price for a unit and a monitor (a 540St + mouse)
-
R{ REALLY appreciate any answers..
-
Ken

There's a bug in the TOS 1.4 desktop that I've come across which prevents installed programs from running properly when the full name is 30 characters long. e.g. I've got Tempus installed so that clicking on any .MOD extender file runs it with that file. However, clicking on 'f:\modula2.sys\def\tqm\vdi.mod' just gives the Show / Print / Cancel dialog instead.

Source record: 231909

It's a real pity that UK has lost magazines for non-kid Atari users. It's because most of the serious users are MIDI people and they are generally not concerned with other features of ST.
I would rather like to see some translation from German documentation (hardware project series, basic guide books, manuals of famous programs like Turbo-C and something like 'a collection of the best German articles of the year').
I wonder if someone in Germany could inform me of the addresses of German magazines by e-mail (I remember buying C't... or 68000er when I went skiing to Switzerland).

4312. PC-Ditto I problem

Newsgroup: comp.sys.atari.st
Date: 1991-05-25 05:02:04 UTC
From: i9853100@ivax.ccit.arizona.edu
Message-ID: <25MAY91010204@ivax.ccit.arizona.edu>
Source record: 231912

I am having some trouble with the software version of PC-Ditto. My setup is : 1040 ST, Supra 20 meg HD, MS-DOS 3.3. Previously, I had DOS installed on my HD and everything worked great. However, I needed to reformat my HD. After I reformatted, and tried to reinstall DOS on the HD, I ran into problems. When I run PC-Ditto and try to run the DOS format to install the system, the format does not work right. I used "format c:/s" which should format the c: partition and install DOS on it. The command runs and says it is formatting the disk, but the disk access light says that it is not doing anything. When it is finished formatting, it does install the system properly (I can even boot DOS from the hard disk after doing this). I get problems, though, when I try to reinstall my ST programs onto the c: partition. Some things work OK and others don't. This seems to be because the disk was not formatted correctly. I have no idea why this doesn't work, as I have had this same setup working before. Does anybody have any ideas???? Help!? By the way, C: is formatted to 4.3 megs, the same size that worked before.
If there is no answer to this, is there a way to use a sector editor to make the partition look like a DOS system disk and then just copy the three files written out by the 'format c:/s' command? I tried copying the files (MSDOS.SYS,IO.SYS,COMMAND.COM) to the disk, but DOS still reports "Non-System disk" on bootup.
Any help would be greatly appreciated!!!!!!!!!!

As a side note, it has happened in the past that an author will take a story, change a few superficial details, and then re-release it. On the subject of "copying" the Scrabble game, there is a difference between a copy and an enhancement. If the first car company took the second car company to court because "they copied our idea", where would we be? Shameless copying of ideas should not be encouraged, but I don't see any problems with significant enhancements. Trivial things, like names, are not things I would consider to be enhancements. As another example, take the Xmodem protocol. Zmodem is far better than Xmodem, and has many significant enhancements, but it is still an error-preventing file transfer program. If these were commercial products, would you expect the maker of Xmodem to take the maker of Zmodem to court? Of course not. The point, I suppose, is that improving an idea significantly is acceptable, while copying it shamelessly is not...

[**FLAME ON**]

Seriously, this guy has *got* to be kidding! I've programmed both Intel and Motorola processors and quite honestly it's a world apart. When I converted from the Z80 to the MC68000 way back in '88, I was shocked at the power and the ease of use with which this processor was programmed (I've been a M/C fan ever since). As a lesser knowing lifeform, I went around in the belief that PC's were the top notch, and I got myself one eager to program its i8088 processor. But shock and horror: I found myself playing with something that was hardly more powerful than the Z80. I soon learned that while the MC68000 is a 16/32 bits processor, the i8088 is a 8/16-bits processor.

While mr. Y. Tsuji gets off comparing the ST/MC68000 with Fujitsu's fastest supercomputers, I would like to quote Personal Computer World upon reviewing the MC68040 and comparing it to the i80486: 'Motorola is the future. No sane hardware engineer would build a computer around a i80x86 unless he would want it to be MS-DOS compatible.'

Yeah, and the MC68040 has a execution time of 1.2 clockcycles per instruction, compared to the i80486's 1.7 clockcycles per instruction. And you did yourself say that the 68k series are programmed faster.

[flame off]

Thanks!

4317. WANTED: Calamus and DynaCADD for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1991-05-25 10:15:09 UTC
From: tdrga@ccwf.cc.utexas.edu
Message-ID: <49502@ut-emx.uucp>
Source record: 231920
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I am looking to buy the two best programs for the Atari ST:

Calamus and DynaCADD.

If you have a used copy of either one that you are willing to part with,
please e-mail me at the address below.

I am looking for complete packages of the latest versions, including all
disks and manuals.

Transferable registration is a plus.

I will pay a reasonable price for the programs, depending on their condition,
competeness of package, etc.

Thanks,

Todd

I don't like to offend people who believe their machines are the best.
These people are everywhere. I thought Atarians were rather disillusioned.
For non-programming people, the sheer power of CPU may be everything but
for myself, speed means the time from the design stage, coding, debugging,
hundreds of times of debugging and rethinking to the end of a successful
execution. 68K is fast for me because I know it very well. Otherwise I'll
be reading the manuals all the time instead of concentrating on the program
itself. If someone gives me a 386 machine that runs perfect BSD4.2,
I'll be faster with it than on ATARI. (For us Japanese, 'atari' is a
rather annoying name; it's like calling 'bingo!')

Well I sent 2 letters with reply coupons, to 2 addresses for the
German magazine ST-Computer.

I never received one reply.

I never see STacy's for sale on the net. Is it that they are not sold that much, or that people are so happy with them that they never want to get rid of them?

> everyone to submit at least 1 favorite dealer to add to this list. It

Why shouldn't it be true? Not the piracy part, but the public domain part. The most common applications for personal computers are word processing and spreadsheets, and there are several PD and shareware programs for each of those categories. Many of the people on this network write their own software, which makes them potential purchasers of development tools, but Sozobon and the Free Software Foundation provide very good C compilers. There's a lot of freeware/ shareware to choose from -- our user group has published more than 500 disks -- and some of it is excellent.

I have commercial software, bought and paid for. Half a dozen games that haven't been played in a year or so. A drafting program I've used once. A C compiler whose library lacks the functions I need and get from dLibs. A spreadsheet that I probably can't even find. A couple of educational programs for the kids.

The software I use daily -- editor, formatter, compiler, shell, communications -- is the free stuff. (The exception is PageStream.)

I wouldn't find this particularly encouraging if I made my living selling software. But I'm on the other end of the food chain, so for me it's a good thing.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi -

Has anyone ever heard of an ST overheating and crashing or something when using the MIDI port? Here's my problem: I've had my 520STfm for about 2 years and only recently started using MIDI software. Two separate sequencers I have used crash occasionally for no aparent reason. The first software package I used was PD, so I thought it may have just been buggy. The software I'm using now (Mastertracks) seems to work fine, but if I leave the computer on running it for more than an hour or two, it crashes. After it crashes, I have to wait an hour or so before I can run the sequencer again. Other types of software seem to work fine (I leave UniTerm running almost constantly and it never crashes).

Any suggestions?

Confused,
Andy Dickinson

B.T.W. My synth is a Roland D-10, if that's a clue.

PORTABLE ADDICTION Issue #01 May 15 by Tjerk Heymens Visser and Yiri Kohl
The newsletter for the Atary Lynx and the Atari Portfolio

Hi folks,
This is the second issue of Portable Addiction. We've had good reactions, so we'll carry on with the newsletter. It will come out around the middle of the month.
We had many requests from people who wanted to know what the computer market is like in Europe. For that reason we have started a regular column.
This month we have alot of Portfolio news, like reviews on PBasic 3.0, Portboot and the Portfolio Toolkit.
If you have any questions about the Lynx or Potfolio just send them in and we'll try to answer them in the letter section.
Here comes...

Tjerk Heymens Visser
Editor.

NEWS AND GOSSIP

The Portfolio II was not on the CeBit in Hamburg, so it will not be released in the comming 2 years.

Hewlett Packard has made it's own portfolio, it has already 0.5 meg RAM built in and it has also Lotus standard (!).
It is as big as the Portfolio and runs on 2 penlites. Detailed info when we have it.

There is said to be bigger memory cards for the Portfolio to be released soon, they will be up to 1 MB and they will NOT be extremely expensive, they might even be cheaper (!!).

Warbirds was released in the USA on 10 May, we've heared that it is a very good game. It has been designed by Robert Zdybel.
It will take about 2 month untill it reaches Europe, we'll have a review in issue 03.

Blockout is probably the next game for the Lynx to come out.

Hole in one and Big Run were to be released in March for the Super Famicom, Super R-Type and Darius Twin will be released in 1991, we don't know when.

There is a new video games magazine in Europe, it has reviews on games of all consoles. It is called Video Games (by the makers from Power Play).

It is German, it has been available since May and it will be a monthly.

LYNX SOFTWARE RELEASE DATES !!!!

We just got these dates and they have not been confirmed by Atari Holland, and
the March and April games have not been released yet in Europe.

MARCH: Blockout APRIL: Superbowl Football
Warbirds Checkered Flag
Xybots Vindicators

MAI: Tournament Cyberball JUNE: Scrapyard Dog
Worldclass Soccer Turbo Sub
Ninja Gaiden Viking Child
A.P.B. Bill and Ted's excellent adventure
Gridrunner Rolling Thunder
Pinball Jam/Shuffle
720 Degrees
Casino

JULY: Toki AUGUST: Ishido
S.T.U.N. Runner Baseball

OCTOBER:Ice-Hockey
Basket Brawl
Geo Duell

NOVEMBER/DECEMBER: No releases planed yet

Further games to be released in 1991:
Pac Land
Pit Fighter
Hydra
Hard Drivin'
Raiden
Leaderboard
Super Skweek

LYNX review GAUNTLET III

I think that never ever before a games reviewer has been bored so much by having
to test such a dispickable game. OK, so the title screen is nice, and the
graphics are quite well, but even these factors can't save the pathetic attempt
at a game. Nice when you start with it, but it gets SOOOOOOOO boring!!
Rush through 40 mazes filled with gold and monsters without losing all your
lifepoints? Nice concept, but 40 mazes can get SOOOOOOOO dull!!

Graphics: 6_ Quite nice
Sound: 3_ Irritating in-game music
Playability: 3_ Boring
Lastability: 1_ About 1 week
Overall: 3_ **********

LYNX review KLAX

SOUND, VOICES !!!!!
These are the most beautifull voices I've ever heard on any system.
The calls for the waves, the cries when you get a five-in-a-row Klax; It's
like it's live. At first the game play becomes second placed, but when you
get going you'll never want to stop. The graphics are nice, the tiles are
clear and the background is beautifull. You don't need to read the instructions
before you start playing, at the beginning of the first level everything is
explained. You must make rows of 3 tiles(horizonally, vertically and diagonally)
At the beginning of the wave the voice tells you what the wave objective is, if
you make a klax that does not match the objective you'll get the points but
it will not count towards completing the wave. The game does not get dull, even
after 100 waves, that's because of the various wavetypes, like Klax, Points,
Horizontal, Diagonal and Tile Waves. So this is a game that won't disappoint you.

Graphics: 8_ Background is static but stil nice
Sound: 9_ Great voices
Playability: 8_ Simple functions
Lastability: 8_ 100 levels so it'll take a while before you
you'll reach the end.
Overall: 8_ Great, simple, fun. Best falling blocks
game ever.

LYNX review ROAD BLASTERS

I was septic at first, but since I've played it it's heaven (till CHECKERED
FLAG is released that is).
The sound is not KLAX-quallity, but it's still nice.
The play is fast (scaling!!!) and it get's more fun when you catch a special
weapon, like nitro-injectors, cruise-missiles and uzi-cannons. It's a nice game
and it's not only attractive to those who like race games. Personally I
doubt that it is worth the full Dutch price (HLF 90,- = $ 45,-), but because it
is the first driving game on the LYNX , and it will take a while untill
Checkered Flag, Hard Drivin' and S.T.U.N. Runner are released I think that it
will be popular.

Graphics: 8_ Full use of scaling
Sound: 7_ Real radio like
Playability: 8_ Smooth driving, good shooting
Lastability: 6.5_ It's fun but 50 levels of the same
can get boring (but good to watch)
Overall: 7_ First racing game on the LYNX but still
waiting for CF and HD.
COMLYNX -SLIME WORLD

A nice idea of the designer of the game was to change some of the levels.
Level 2 changes from exploration into cooperate, where you have to work
together to find the end(you can't shoot each other but you can clean your
partner with your water pistol).

In level 3 you have to compete with each other, there are no extra slime-shields so the first Todd gets to pick up the shields and gems. There are special icons that make you shoot slime, so you can kill other Todds.
Level 5 becomes a COMBAT level, this level is totally different from the single player mode. There are not much aliens in this level but there are lots of mega bombs and slime icons, the goal is to blow up other Todds as many times as you can. We only tested in two-player mode(we couldn't find more people with Lynxes)and each player has 5 lives, but maybe in more-player-mode each player has more lives(we don't know). When you ComLynx Slime World this is the most recommended level.

SCREEN SCENE EUROPE

This month Screen Scene is a report of our visit to Germany.
Till one year and a half ago Germany was still devided in east and west. Then the wall came down and suddenly western things flooded the eastern part of Germany. We have visited east and west, and compared.
Western Berlin has lots of light-adds on the street(The whole city is like a Cyberpunk story!!). Eastern Berlin however has always been isolated, there were only 2 types of cars and computers were totally out of the question (though we met someone who made one himself!).
When "The Wall" came down western companies came to the east and started to make big money there. For that reason you'll find the Lynx in every shop in the eastern part of the city. But we didn't see a Lynx in the west (which has ofcourse more shopping districts), even in "Das Kaufhaus Des Westens", the biggest mall in Germany, there was no Lynx!! Argh!!!
Games cost DM 80,-, which is about $45,-.

Next month we'll have a full story on how Nintendo failed in Europe, and why Sega has been so succesfull. Plus information on PC Engine, Gameboy, and the normal computers.

PORTFOLIO DEPARTMENT:

Portfolio Toolkit v2.0

This "Toolkit" contains a number of utilities for the Portfolio. Personally I didn't find them all very usefull, but there certainly is something for everybody.
The utility that comes in most handy is the new DIR command, to make the directory more easy to read. It's a real good replacement for the old DIR command, as this wasn't very hot to say the least.

There's also PORTBOOT. This command needs no parameters. It just pops a reboot menu which let's you do a warm reset, cold reset or no reset at all. This can come in very handy.

A nice little utility is PORTTONE, a tone generator. You can even program the notes into a file and then replay it later! WARNING: Sound drains the batteries.
The other utilities can be nice if you have any use fore them. Just check the package out, it's freeware. You might have to search a little while before you

find it, and the only thing we can say is that the package is made by Centennial Software Systems. If you really can't get it anywhere just send us a diskette envelope with enough stamps included for the postage back and your address to:

Yiri Kohl
Liendenhof 113
1108 HE Amsterdam Z.O.
The Netherlands

PORTRIS

This is a nice little Tetris for the Portfolio. The Portfolio is held vertical (Hey! It allmost seems like a Lynx!)and the falling blocks are controlled by the keyboard. This is not the most sophisticated Tetris version, but if you are a true addict you'll probably like it.
Again if you can't find it anywhere, you can allways order from Yiri Kohl.

PBASIC 3.0

This basic for our alltime favourite palmtop was also programmed by our good ol' BJ Gleason (This guy must be programming all day! I like him!).
It works with the build-in editor to save memory, and supports all mayor basic commands. Version 3.0 has full string handling, except for the Inkey$ command. PBasic is more or less QuickBasic compatible, which makes it possible to program while on the run! Yeah! There are also a lot of Portfolio-only commands. you can easily draw an error window, or check the revision number, get the current cursor position, switch between display modes ect...ect...

Conclusion: I think that every self respecting Portfolio owning basic programmer should have this tool in his Portfolio. It takes around 30K, so that isn't much either.

If you want to download PBasic 3.0 you must have PKUnzip or something like that. You can find the PBas1.zip on CIS and GEnie, but I think it is already spread all over the world.

~~~~~~~~ADVERT~~~~~~
Do you need graphics for your own games, and you can't draw? Well fret no more!

LETTERS!!

James Hague:
>For example, you gave RoboSquash a 5 but the note next to the number says it's
>"pathetic." Please don't write weenie reviews by always trying to come up
>with something positive.
And:
>If something really stinks, please say so.
Reaction: A game can be pathetic but it can be saved by it's music or graphics.
Maybe you're happy with the Gauntlet III review.
>Why a newsletter about both the Lynx and Portfolio? They have ABSOLUTELY
>nothing in common except that they are portable and produced by Atari. SO WHAT!
>One is a "real" computer and one is a game machine; there is no overlap
>between the two user bases.
Reaction: You're right but it can be interesting to read something about the
Portfolio even if you don't have one. BTW have you seen PTetris??

Corey Liu:
>Nice job guy's! The more I hear about the Lynx, the harder it is to resist
>the temptation to get one!
Reaction:Just what we need, more Lynx fanatics!!!

Na Choon Piaw:
>Looks interesting, but the tips section doesn't seem to cover anything
>not covered already in rec.games.video
Reaction: You're right but we live in Holland(do you know where that is?)
and all the news(like magazines and new games)arrives later here.

Thanks to everybody who replied to us about the newsletter, we are sorry we
can't answer each of you personally or react to your comments in the newsletter
because we had lots of reactions even from Cyber Labs!!).

Special thanks to: Andre "ALU" Luyer
And everybody who have spread our newsletter on the various
BBS'

Here follows a questionaire because we would like to know how our readers like
the newsletter.

1) Which systems do you own?
PC
Atari ST/TT
Amiga 500/2000/3000
Portfolio
Lynx
Game Boy
Game Gear
Famicom

2) Do you find PA: boring
mmm
nice
megagreat

3) Do you wish PA to appear: weekly
once in every 2 weeks
monthly

4) Do you want PA to be: longer
shorter
as it is

5)What do you think of PA's reviews?
I wipe my but with them, they stink
too dated
not enough info
good
mega great

>_____________________ correct me if I'm wrong ______________________________

How's this: TT030, 4M, 50M HD, with Color Monitor - $2680
Subtract about $500 without Color Monitor. I believe that you can also
get the 2M TT030 for just under $2000. A 4M model includes 2M of ST
RAM on the motherboard plus another daughterboard with 2 more Meg. One
can expand this ST RAM daughterboard to 10 M. The fast TT RAM includes
another daughterboard with 1M Sims to add another 4M to make a TT030
8M model. Remove the 1M Sims from this TT daughterboard and replace
them with 4M Sims to expand TT RAM to 16M. Result total RAM = 10 +
16 = 26M. I was told today from a dealer here in the Chicago area that
these RAM expansion boards will be ready for sale around mid June here.

CUL,
Chuck

4327. SuperCharger IBM emulator for sale

Newsgroup: comp.sys.atari.st

I just bought a 1 meg SuperCharger from another reader of this net. It works great, and is literally in brand-new condition. I don't really need to sell it, but I don't need it as much as I though since I found out that my roommate-to-be for next school year has a real nice IBM PS-2. I have all the docs, cables, software (including MS-DOS 4.01), etc. I will pay shipping. The cheaper-than-cheap mailorder joints generally want more than $400 for this thing. Make me an offer or just drop me a line for more details.

> simms.

This 19-pin-connector, Atari used is indeed difficult to get. When
I moved my Mega-ST 'motherboard' into a tower-case using a
ready-to-assemble kit, I found, that 25-pin-connectors can be used
instead: just tear off 6 of the pins. The shielding on the 24-pin-
connectors fits easily over the distance-bolt (right term ? english
is not my first language :-)) that's on either side of the connector
soldered to the motherboard.

Hope, that helped you.

Greetings, PMH

>PS: to be fair, i don't know if the bug still is in TC's latest
>version (i only have 1.1), but if yes, at least you now know how
>to make the thing compile a working zoo. :-)

The bug was fixed in Turbo C version 2.00.
It wasn't really a bug but a "design restriction" - it made programs both
smaller and faster (it's even mentioned somewhere in the manual!).
The new compiler uses only 16 bits for array addressing if and only if it is
sure that the array addressed is smaller than 32 KBytes.
Otherwise all 32 bits are used...
Note that this is _not_ mentioned in the new manual; but it was one of the
first things I tried out when I got my 2.00 update... :-)

MfG,
Martin

4332. Patches for TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1991-05-26 19:10:56 UTC
From: millert@tramp.colorado.edu
Message-ID: <1991May26.191056.9550@colorado.edu>
Source record: 231933

I'm about to get TOS 1.4 and I was wondering what auto folder patches I'll need. The ones I was going to put in are tos14fix.prg (patched version), vdibfix.prg, poolfix3.prg (or maybe Claus Brod's version), foldr100.prg, and consbfix.prg since I use quick ST.

Are there any that I missed? Also, is pinhead faster than the TOS 1.4 fastload? (or I guess I should say faster enough to warrant its use, I'll be using a 4 meg ST)

thanks in adcvance,
todd

Message-ID: <1991May27.011852.23760@watdragon.waterloo.edu>
Source record: 231935

Hi! I've just started having a problem with my SC1224 (colour) monitor.
When I'm using the computer the screen will go dark, with the green text
only being barely visible. After being off for a while I can use it again.
Does this sound familar to anyone?
How much will Atari charge to fix it?

Brian

You don't need FolderFix with TOS 1.4.

PinHead can help as it can be programed to clear memory that the OS.
does not clear, and from what I believe is faster than the OS.

>>
>>Why not?

>Because the biased reporting quite clearly showed where ST Abusers sympathy
>was and wanted you, the gentle reader, to feel the same.

The fact the Spears has the money to tread on the PD library IS VERY RELEVANT.
Even if the Laws are wrong, or the library's actions are legal, they may not
receive justice, simply because of a lack of funds.

>I'm surprised Dave gets off with Hacman 2.

I'm GLAD.

>>I think PD authors should be free to write whatever programs they want.

>It would be nice but as stated earlier, by others, if PD stuff competed really
>strongly with commercial products then companies would go out of business.

So what? I think if someone is willing to give you something BETTER for
FREE, then they shouldn't be punished. The problem is too many people like
that poster have the attitude "It would be nice, but the Law doesn't allow it".

I'm all for laws, but they are only laws, not statements of correctness.

Laws can be wrong.

4342. Bug in TT hardware?

Newsgroup: comp.sys.atari.st
Date: 1991-05-27 10:17:19 UTC
From: seimet@rhrk.uni-kl.de
Message-ID: <1991May27.101719.2923@rhrk.uni-kl.de>
Source record: 231946

Did anyone ever try to save the last four bytes of TT-RAM on the TT's internal hard disk? This operation always fails because the scsi controller reports a bus error. (You don't get any bombs, because it's not a processor-related error. The hard disk driver simply aborts with the usual alert.)
This problem doesn't seem to be driver dependant. It looks as if the controller tries to access not only the last bytes of TT-RAM but some bytes on higher adresses, too. Of course, at these adresses there is no RAM, so this explains the bus error. If the last byte to transfer lies at least four bytes below the end of the physical RAM everything is fine.
Is there any reasonable explanation or is this some kind of hardware bug?

4344. Mega STe applications

Newsgroup: comp.sys.atari.st
Date: 1991-05-27 11:04:04 UTC
From: johnj@knor.prl.philips.nl
Message-ID: <2819@prles2.prl.philips.nl>
Source record: 231944

Wow, I've got my Mega STe finally.
However, it's only 2MB, as my local dealer only received those.

A 48MB 28ms hard disk *IS* fast.

I got First Word Plus (second to last version) to work,
but was not able to work with long pathnames on the hard disk
(but this has nothing to do with running on the Mega STe).

Degas messes up the screen.
Degas Elite seems to work fine.
Both Degas and Degas Elite seems not to be able to get started
with the PI* or PC* images loaded when double clicked on these files.

Notator 3.0 works (on 8MHz),
however, I could not start it the usally way.
Instead of clicking NOTATOR.PRG as I was used to on my 1MB ST
(error msg: "p_ybox not found"), I had to click on SOFTLINK.PRG.

On its turn, SOFTLINK came up with the pop-up window
saying "Not enough memory", and lead me to EDITLINK.PRG
to divide the memory. Setting Memory 1 partition for Notator
to 1200kB and memory partition 2 to the rest available, was
still not accepted by SOFTLINK. I had to subtract a few kB
from the second memory partition before SOFLINK could be
started which on its turn started NOTATOR.
Tonight I'm gonna try the full features of UNITOR coupled
with Notator, as I used it as a simple dongle(key) until now.

One bad thing: The fan is kind of noisy.
This is no good for being used in a (little) music studio
during (synchrone) microphone recordings.

4345. Mega STe Question (or Problems)

Newsgroup: comp.sys.atari.st
Date: 1991-05-27 11:38:34 UTC
From: johnj@knor.prl.philips.nl
Message-ID: <2820@prles2.prl.philips.nl>
Source record: 231807

As I stated in my previous message, I finally (!) got my Mega STe.
I love the machine, it is good, except for the booting process
(and the noisy fan).

I only had a 1MB ST without hard disk before, so I do not know
if the following questions are particular for a Mega STe.

Is the following normal?

1. When I switch on the computer, it takes very long (>30s)
until it boots from hard disk.

2. When there is no floppy disk in the floppy drive
the light of that drive stays on forever (after booting).

Please reply (see below) quickly, as I do have a
one week money back garantee in case of problems.

I found out the following (undocemented) sequence for a quicker
start-up, however I do not like it:

1. Switch on all peripheralls (monitor, printer, etc).
2. Switch on computer, having an empty formatted disk in the FD.
3. Sometimes the light of Floppy drive flashes(=on) shortly.

or: replace 1.- 3. with: Press Ctrl-Alt_RightShift-Del.

4. Light of Floppy drive flashes aprox. 1-2 seconds.
5. Light of Floppy drive flashes aprox. 1-2 seconds once again.
6. Press Return.
7. Boot starts from Hard disk immediately now.

The same is true when no disk is in the FD, but then
5-6 changes in:
5. The light of the floppy drive goes on and stays on.
6. Wait until the disk-head crash noises are over
and press Return then.
(Note the drive light stays on, even after the system
has started and when running applications. It will only
go off after using the FD at least once).

Any comments?
Please!

Thanks!

BTW, I will be off the net for some day from May 31th onwards
because of a physical moving to another location, so I may not

be able to read all replies on the net, as net replies takes
a few days (sometimes).

So what I mean to say is >>> PLEASE REPLY BY EMAIL <<<,
as it is faster (normally).
I will summarise when I'm back on the net.

Message-ID: <2821@prles2.prl.philips.nl>
Source record: 231808

As I stated in a previous message I finally received my Mega STe.
Unfortunality, it came with 2MB RAM only, but I did not like to
wait another month for a 4MB machine, as I sold my previous ST
weeks ago.

So my questions:

1. Is it true that updating from 2MB to 4MB is easy to do?

2. What type of SIMMS (spelled?) do I need?
Size, Pinning, Speed, etc.

3. Is it true that you only have to unscrew one screw,
lift up the hard disk and place these SIMMS in their sockets?

4. What price do I have to expect?
Dollars (Am.), DMark, or NL-Guldens, any is ok.

Thanks.

Please REPLY BY EMAIL, as net-replies may take too long
(I'm moving to another location Friday 31 May and may not
be able to read news for some days = not reading replies!).
I will summarise ofcourse.

> Technology Way, Orem, UT 84057.

I have never been a WordPerfect fan, but I have to say that I find this very disturbing. WordPerfect has become a standard on nearly all computers, early releases also found its way to the ST. Unfortunately, these were bugridden to a such extent that they were practically useless.

I have seen people buy computers solely for the purpose of using WordPerfect on it, I have seen people trade in their ST's because of the unavailability of WordPerfect on the ST (Call it madness if you like, I do), and now Atari goes off and says 'NO!' to the possibly most advanced version available on any platform.

I can understand Atari perfectly well, but there comes a time when Atari has to think marketing rather than pure profit, like they do here in Norway. I can tell you: IT DOES NOT WORK AT ALL.

Send off your letter to Atari and WordPerfect Corp!

4355. My stupidity

Newsgroup: comp.sys.atari.st
Date: 1991-05-27 21:42:35 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <16582@helios.TAMU.EDU>
Source record: 231802

I retrieved the SOZOBON compiler *.zoo files from the USA archive in michigan. Since I don't have a un-zoo program, I retrieved that too.

I have a problem though. The sozobon files have directory names that I want to keep. If I use the novice "zoo -extract" command, all of the files are retrieved without pathname. I looked at the man pages and tried the followin command:

zoo {x}[//] d:\term\download\sozobon1.zoo

But zoo doesn't understand and just give me the usage line. Would someone tell me the proper zoo command and flags needed to retrieve zoo files with their original pathnames.

Thanks.

BTW is anyone interested in the information that I received about modem control status. I'll be glad to post the mail that I got.

Mark Lehmann

4356. Word Perfect v 5.1 on the ST

Newsgroup: comp.sys.atari.st
Date: 1991-05-27 21:59:53 UTC
From: revpk@cellar.UUCP
Message-ID: <imLm31w164w@cellar.UUCP>
Source record: 231812

I'm sort of the Word Perfect guru at work, and apart from its horrible slowness in printing and generating tables of contents, version 5.1 for the IBM is truly the best word processor going.

I suggest that, if Word Perfect was developing version 5.1 for the ST, perhaps some enterprising young programer could request the source code for it if WP decides not to develop it into a full application.

Preferably, one should retain printer driver compatibility with MS-DOS versions as well-- WP has the best printer support I'ev ever seen.

4358. Re: Using Mac fonts

Newsgroup: comp.sys.atari.st
Date: 1991-05-28 01:00:04 UTC
From: hyc@hanauma.jpl.nasa.gov
Message-ID: <1991May28.010004.2754@jato.jpl.nasa.gov>
Source record: 231813
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

When I set about converting PD Mac fonts using NeoCept Fontz!, I had access to a nearby Mac as well (my roommate's, at the time.) I used a Mac app called Font Librarian to split up Font sets into individual files, and then MacArc to collect them into a single .ARC file. Then I just used Ymodem to transfer to the ST. (Stupid Mac doesn't have a free Zmodem that I'm aware of. Of course, this was also a couple years ago...) Unarchive the files on the ST, load into Fontz!. There's nothing particularly difficult, it is just very very tedious/time-consuming. You need to spend a great deal of time touching up the scaled bitmaps for your particular output device. The Mac fonts are generally for screen and imagewriter, which are both 72x72dpi output devices. The ST screen is 80 or 90dpi depending on how your monochrome monitor is adjusted... Fresh out of the box an SM124 gives you 90dpi (and that 1 inch black border...). If you're not too fussy, and more than a little bit lazy, like me, you can use the screen fonts directly without scaling them, just setting the proper amount of spacing.

Scaling for your printer is a big hassle, one that I only did for a select few fonts. Best advice is to take the largest available screen font, then scale that to the largest desired printer font. When that is done, it'll be less work scaling down to the smaller printer font sizes.

My biggest gripe with working with the printer was that I had no real control over the actual resolution. (Using a KXP-1091i, and the FX driver.) I really wanted to write my own GDOS printer driver for the KXP, but never took the time to do it. I guess this is now a moot point since FSMGDOS is coming out...

>1. When I switch on the computer, it takes very long (>30s)
> until it boots from hard disk.

Apparently, this is Atari's wonderous delay for allowing the hard drive
to come up to speed. I think there's a way to cancel the delay with a
keypress, but I don't know what it is. Hey, BTW, isn't there a PD program
called ROACH or something that changes the delay?!

Jerry Pournelle in his 'review' in Byte also commented on this delay. He
made it seem like his TT waited for several minutes however.

>
>2. When there is no floppy disk in the floppy drive
> the light of that drive stays on forever (after booting).
>
There's some programmer at Atari who likes having a lot of lights on
his machine. If he had his way, the ST would have an oscillating red glow
like the car, KITT, on "Knight Rider." I heard this is the same guy who
decided that they should put the joystick/mouse ports on the underside
of the STFM/STE machines. This is also the guy who decided that the
keyboard port on the MegaSTe/TT detachable keyboard should be on the
opposite side as the keyboard port on the main console.

This floppy light phenomenon has been around forever and ever. I can't
believe that they call this a feature. I agree that it is annoying.
When I got my STe and it did the same, I called Atari Technical Support
and asked them about it. They said that if it doesn't hurt anything,
don't worry about it.

>Please reply (see below) quickly, as I do have a
>one week money back garantee in case of problems.
>
>
>I found out the following (undocemented) sequence for a quicker

>3. Sometimes the light of Floppy drive flashes(=on) shortly.

According to Allan Pratt, the floppy light always comes on during a
reboot to initialize the keyboard.

#2 helps so the computer doesn't choke on the drive waiting for a disk
to be installed.

>or: replace 1.- 3. with: Press Ctrl-Alt_RightShift-Del.

which is a coldboot and is very handy.

>go off after using the FD at least once).
>
>Any comments?
>Please!
>

Having the floppy light on is quite annoying. No, I don't lose sleep over
it, but it is a pet peeve. I also don't understand why the floppy waits
so long until it 'decides' that there's no floppy in it. There was some
discussion about this a while ago, and it was mentioned that MS-DOS
systems do this too. But I've found that they don't wait nearly as long!

>So what I mean to say is >>> PLEASE REPLY BY EMAIL <<<,

A copy of this article has been sent to John. I just thought you'd
want to hear me bitch and moan. :^)

From: blackbox@pfunk.hanse.de
Message-ID: <A0b64gka@pfunk.hanse.de>
Source record: 231837

In <CMM.0.90.2.675111152.larserio@kvart.ifi.uio.no>, LarsErikOsterud writes:
>Does anyone have an EASY TO UNDERSTAND description of the .IMG Gem bitmap
>file format. I have written some scanner software but today I use the DEGAS

Isn't the description of the IMG-format implementef in the monthly posted
picture-format list ? Just a moment, i take a look.....

--------------cut----------------

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines

? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored
separately starting with plane 0. There is, however, no standard way of
storing the color palette. Some programs may save the palette in separate
files, some may extend the header. For this reason, you should never
assume the header is 8 words long, always get the header length from the
2nd word of the header. Also, the line width in the 7th word is the number
of pixels in a line. Since the data is encoded in byte-wide packets, the
actual unpacked line width is always a multiple of 8, and may be 1-7 pixels
longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern
length" word in the header. Repeat this
pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline
is to be used multiple times. Read the

following record:

1 byte flag byte [$FF]
1 byte number of times to use
next scanline data

The data for the next scanline follows,
compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte
determines the number of bytes to use
literally. The literal data bytes follow.

otherwise Solid run. The value of x determines
what to draw. The high bit specifies whether
the pixels are set or cleared. A 1 indicates
a byte-run using $FF, a 0 indicates a byte-run
using $00. The low 7 bits, taken as an unsigned
quantity, specify the length of the run in bytes.

-------------end---------------

4362. Re: Atari 540ST Questions

Newsgroup: comp.sys.atari.st
Date: 1991-05-28 05:43:31 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <937m33w164w@ersys.edmonton.ab.ca>
Source record: 231819

U43610@uicvm.uic.edu writes:

> 1) How are the graphics?

The graphics are good. 640 X 400 in Monochrome, 640 X 200 in Medium Resolution w/ 4 Colors and 320 X 200 in Low Resolution w/ 16 Colors. Programs like Spectrum allow you to draw pictures with as many as 512 colors on screen at once in Low Resolution. The Monochrome display is crisp and enjoyable to use. There are many graphics programs available to use.

2) Is there a CAD system available for the Atari ST units? How GOOD is it?

There are several CAD programs, although I have never used them. CAD 3D 2.0 is supposed to be impressive, as are other CAD programs. I do not know the production status of these products, but if they are not being sold anymore you may be able to purchase them used{

> 3) How good is the mouse system on the unit?

The mouse isn't bad at all. It has two buttons, and looks fairly good. It is a nice mouse, but there are third party mice available if you don't like it. The Atari mouse is FAR BETTER than the Mac mouse, which I have to use at school. It has a better response and moves faster.

> 4) How available is software? Is it expensive? Is is widly pirated?

There are many software packages available for the Atari ST, but not nearly as many as the IBM systems. Atari is a smaller company, and has a smaller share of the market. The programs are of excellent quality in most cases, with a few exceptions. Software usually sells{for prices between $70-$100, except in the case of Word Processors which are between $120 (Word Writer W/ Dictionary & Spell Checker) and $200 (Word Perfect and the others{).

> 5) What storage devices are available? Is there a floppy dbuilt in?

Yes, there is a 720K floppy drive built in. The older systems had 360K floppies, but the newer ones don't. It is fairly fast, but don't expect miracles. It seems faster than the IBM counterparts, though. There are also the usual assortment of Hard Drives available. I haven't seen any CD-Roms yet or Optical Drives yet, though. There are removable Hard Drive cartridge systems and 10 MEG floppies, though.

> 6) Is there a telecommunications package for the Atari ST?

Yes. There is also a serial (and parallel) port on the machine. The be best communications package I have seen is Interlink, which pretty much

covers all the bases. Th9e only thing it doesn't have is Zmodem, which
is supplied by another (PD) program.

Fact: Taming Of The Shrew (Shakespear) is EXTREMELY similar to a play by another author called Taming Of The Grue (or some such{similar name).

The comment had a lot to do with this discussion, when you consider the material following that you neglected to mention in your flame. This comment was meant to add a little humour, but it seems it failed. Only the following material was relavent. Just in case you are interested in the above fact, you could read the text before the play "Taming Of The Shrew". The Swan Edition, to be specific.

>So what? I think if someone is willing to give you something BETTER for
>FREE, then they shouldn't be punished. The problem is too many people like
>that poster have the attitude "It would be nice, but the Law doesn't allow
>it".

It could hurt some companies every bit as much as piracy, which is the illegal
version of free software. Say a company comes out with a new and very
innovative game for the ST in the UK. Some other group produce a clone,
a BETTER clone and start distributing it via the net. Soon the world will have
the PD version before some have even heard of the commercial one. When the
commercial version turns up reviewers would be saying "Not as good as the PD
version" and so no sale. Does that sound extreme? Maybe, but that is what
worries companies and that is what they are trying to prevent.

If a company lets things slip by then things can get out of hand. Look at
NEOchrome from Atari. Lots of people got version 0.5 free with their ST way
back. Despite the documentation clearly stating that it was a preview version
and the fact that later versions were on sale, PD libraries see it as free.
I have a letter from Atari saying that it is not.

>Laws can be wrong.

Ain't that the truth! Nuff said.

Hmm, well, you should not actually type the braces and brackets. They are
metasymbols meaning you *must* type one of the characters in the braces and
you *may* take one (or more) from those in brackets. You should try the
command:

zoo x// d:\term\download\sozobon1.zoo

I wonder which Atari mouse you're talking about. All Atari mice I've used are the most dreadful rodents I've ever come across, second to none, not even the "original" VAXstation-100 mouse (ever seen one of these?) feels as bad.

Finding a replacement mouse seems to me one of the first priorities of an Atari owner. I recently ordered a Naksha mouse, and await it eagerly.

I'm saying this based on the general slowness of the mouse (a mouse accelerator is a possible way around this particular problem), the unbelievable way it resists being effectively cleaned (the metal rollers inside seem to get corroded or something, and will tend to stick, for instance my mouse has this tendency to not go left), and the number of times you have to press the buttons (and the strength you have to apply too) before it considers your gesture as a click.

4369. Re: Mega STe Question (or Problems)

Newsgroup: comp.sys.atari.st
Date: 1991-05-28 10:43:15 UTC
From: johnj@knor.prl.philips.nl
Message-ID: <2827@prles2.prl.philips.nl>
Source record: 231825

My question about the boot sequence of the Mega STe
seems to be not totally clear. So I try to add the
correct information here and come straight to the point:

1. My Mega STe waits 30 seconds before it boots from hard disk,
although I do have an empty (formatted) floppy disk in the
floppy drive.

2. The special point of my start-sequence was, that I could
only decrease the idle time (in front of the booting process)
by pressing the 'return' key on the correct moment.

This correct moment is immediately after the 3rd switch-on of
the FD-light after switching on the computer, or immediately
after the 2nd switch-on of the FD-light incase of a reboot
by means of the Ctrl-Alt-RightShift-Del key press.

Note that the first flash of the three flashes mentioned above
is very short, and not noticable if you do not pay attention,
while the other two flashes (in both re-boot situations)
are very obvious as they last for a second or so.

So please let me know if these two procedures are correct.

As I stated before, I will be off the net for a few(?) days
from Friday May 31th onwards, so I probably won't be able
to read replies on the net, as they sometimes take a few days...
and my money back guarantee expires in a few days!

So please REPLY BY EMAIL .
I will summarise
when I'm back on the net.

It sounds like the 68030 has "pre-fetch" active. You can
shut this off "manually". Check a 68030 instruction list. The
only problem might be that the "pre-fetch" might be built into
the driver and not over-rideable without writing your own driver.
That's probably not going to be a problem, but I've never seen
the code so I can't say.

Actually I was just reading a collection of essays by Isaac Asimov in which he refers to an incident in which a plagairized story was published in his magazine (or at least the one that bears his name) without the editor's knowledge. This sort of thing does happen quite often (well, compared to the frequency with which I would suspect that people would be stupid enough to think they can get away with it).

>Look, take this discussion to 'net.legal' or whatever it's
>called. You're not saying anything that's "special" to the Atari
>community, so you may as well talk to people who are more likely
>to be interested in the discussion than those in this group.

I think the legal issues related to software have always been of particular interest to the Atari community, from piracy to copyright and so on. Because the Atari market is so heavily dependant on shareware, legal decisions regarding copyright status and licensing do have a special interest for us.

For instance if a licence is held by a large software corporation for a particular application which has done quite well on other computers, yet the corporation has no intention of developing it on the Atari, to what extent would a piece of shareware which closely approximates that application be a copyright violation? And how close do you have to come before you are infringing on a copyright? Reverse engineered? File compatibility? Look-and-feel (see Unix Review, Vol. 8, No. 12 on that one)?

I mean if it is obvious to the court that Scrabble is just a variant on crosswords, and while entitled to its particular format and graphics the company owning this game cannot extend its copyright to EVERY crossword variant (regardless of medium), then close duplicates would have legal grounds to refute the owning company's claims.

So this particular issue does have a lot of relevance to Atarians, since it is a piece of software for their machine being jeopardized, and because these alternate distribution systems (shareware, etc) are so important to the Atari community. While I haven't generally been interested in playing computer games since high school, and so have never even seen STrabble, I AM interested in the legal results in this case.

4382. German PCB-CADs

Newsgroup: comp.sys.atari.st
Date: 1991-05-28 15:04:43 UTC
From: ma62141@cs.tut.fi
Message-ID: <1991May28.150443.1637@funet.fi>
Source record: 231835

Hello there all PCB-designers!

Here is short review of some German PCB-cad packages for Atari ST.
I evaluated the demo versions the authors of those programs sent me.

The biggest drawback (or advantage to some of you:=) is that all these
programs are in German and the documents are also in German.

---

program: Layout 1.3 PD
author : Uwe Klatt
price : PD

This is a working public domain PCB-cad package . There
is output support only for 9-pin printer and it's limited to 2-sided
boards. But it's very good starting point. It is somewhat slow but it
has adequate zooming and object handling functions. I liked this one
(especially the price range is OK :=).

You can't really use accessories with this program (it tends to crash
then).

---

program : Connecti_CAD
author : Uwe Klatt
price : about DM 50,-

Connecti_CAD is basically expanded version of Layout 1.3. It is
faster, can output to 24-pin printer (+ other formats) and it has more
line widths and sizes of soldering dots. Nice "Mac-type" fonts.

---

program: PCB-Edit
author : Rosin Software
price : about DM 200,-

This program is different from all the other programs in the way it
handles graphic objects. It's not vector oriented (when scaling is
relatively easy) but raster (or pixel) oriented so it "draws" the whole
layout to the memory and outputs to screen the visible portion of
that layout. Because of this concept it is very fast but all the
zooming function etc are seriously limited.

You can edit objects pixel by pixel and thus generate some weird
pad-forms and lines. To a certain degree it's only general drawing

program but this means that you can also draw schematics with this
package.

---

program: PCB-Layout
author : Thomas Praefcke
price : about DM 200,-

This is very similar to Connecti-CAD but the routing options are
better (program does intelligent routing).

Doesn't support 9-pin printer (but supports 24-pin printer).

Accessories work well with this program.

---

program : Platon 1.4
author : VHF-Computer
price : about DM 300,-

This is the most comprehensive PCB-CAD package of all these reviewed.
Almost all of its parameters are user-configurable (line widths,
pad sizes etc). There are plenty of output formats, dot-matrix
printers, laserprinters and possibly gerber (that may cost extra).

You can also build a component libraries and extract the
bill-of-materials.

The user interface is somewhat confusing (drop-down + hierachical
pop-up menus + icons) but there really are plenty of options.

There is also version 2.0 available (it costs about DM 500,-) and
its evidently enchanced version of the v1.4 :=).

I could send demos of these programs to atari.arch or some
similar place provided that

a) they aren't there already
b) there is enough general interest to the demos
c) it is totally legal (maybe have to check from the authors)

I haven't used these programs for real designing, just gone through
the menus & options and checked what's available so if there are real
users of these programs around they may have different opinions and
views of many things.

Comments & corrections are welcome.

Obligatory disclaimer:
I'm not connected with any of the previously mentioned PCB-CAD:s :=)

>ran the largest set of software.
>
>Well is it my imagination???
>
>Is there a solution to all this bombing?
>*flame off*
>

I just bought a 1040 STe and upgraded the memory to 4 meg. I've noticed that a lot of pd software others have suggested as great programs do not run or bomb my system. Examples so far are CAL 5.0, which will not run, and MELT, which melts the screen then bombs the system. Some of the software that I wrote with Personal Pascal long ago (I gave up writing for the machine about 3 years ago) has some odd reactions on the STe that my old 1040 did not.

I'm also interested in what the architectural differences are between an ST and an STe.

From: alexd@milton.u.washington.edu
Message-ID: <1991May28.171052.3898@milton.u.washington.edu>
Source record: 231806

For years I have been waiting for a TT.. but when I finally saw one at my local dealer's, I wasn't impressed enough to plop down the cash for a TT/8... since the TT/2 is almost worthless.

My dealer has had TT's for months and hasn't sold a single one yet... though he tells me IB computers has been selling them mail order. BTW: my dealer price on the TT/2 sans monitor is $2,100. Could this be the problem? Seem like a reasonable price. But.. to get into 8 megs at an additional $800 or so... i wonder...

Are dealers selling these things?

cheers!

>>price is in the 80386 range.
>>
>
>Not to flame you or anything, but I seriously doubt all three claims. Perhaps
>you could provide some numbers to substantiate them?

I doubt it too, there was a demo of the TT here by an ATARI club, the
representative said the TT 68030 was equal to a 386-20 machine and only
2 MIPS, I found this hard to believe since there was so much talk of it,
I still think it does close to 8MIPS, but since there is so much people
disagreeing with the performance of the TT, I don't know what the real
MIPS on it. Also does anyone know how many MFLOPS the TT does? Like I
said the TT is not equivalent to the i486 and probably not the new 386-40.
The 386-33 is running 7.92 MIPS and the i486-25 is 11.1 MIPS.
THIS IS NOT A FLAME (I am a ATARIAN and probably always will be)

Jeff

Roger.Sheppard@actrix.gen.nz (Roger Sheppard) writes:

>You don't need FolderFix with TOS 1.4.

Actually you *need* sometimes Folderfix also with TOS 1.4.
I noticed it when I was installing TeX 2.0.

The installation documentation said that you will need a
forderfix, and I did not believe it, so my installation
was terminated on one point. There was very many files
and folders, so the limit in TOS 1.4 might be higher, but
there is a limit. But there was no corruption or other
problems, so I added a folderfix to my ICD driver and
continued instalation.

>PinHead can help as it can be programed to clear memory that the OS.
>does not clear, and from what I believe is faster than the OS.

The main idea behind fastload bit and PinHead is that
we do not zero whole memory before program load.

By the way about the fast load bit. Some accessories do
not behave well when it is on.

>who's got this disk, beware.

Having read this message I immediately checked a bunch of my floppies.
I used a recent version of VKiller. I *did* find a virus, but I'm not
certain it came from the June ST User disk.

VKiller reported the "Green Goblin" virus. I'm not sure where
this virus usually resides, but when I checked my June ST User disk
VKiller reported no virus present. It didn't find a virus on any of
10 other disks I also checked. This brings to mind that 1 of the things
I looked at from the Net recently was this "only_ste.lzh" sound
demo package. Now this is a strange package with what seems to
be a whole disk compressed into an ".MSA" file which in turn was
LHARC'd. I unpacked this kit just this morning. When I unpacked
the disk I used the MSA.PRG auto-formatting command. It seems to
me that this method of packaging might allow for transporting of
boot sector or other viruses. Has anybody else unpacked this demo
kit recently?

Can I further the request, and ask what Atari magazine readers of the net find most useful? If possible, could someone post/send addresses for those magazines?

I've been trying for 2 weeks to find any Atari magazine locally so that I could look at current mail order prices, and, since I just upgraded my machine, consider once again subscribing. In the large Capital District of NY I haven't been able to find so much as a game magazine that even mentions Atari on the cover! I know that STart is gone, but Amiga's have 3 serious magazines with available distribution around here; Atari has none. I'll probably end up subscribing because of this, but what's going on here?

I've seen good mice from Atari and still own (and swear by) my original Atari mouse which is at least a couple years old and has been HEAVILY used and abused by my brother playing Dungeon Master I and II. Keep in mind that this mouse was made in Japan and not country XYZZY. I do swear by MY mouse, but I have also seen others that were "most dreadful rodents"... I've found that the Japan mice keep good tracking, button touch, and feel with standard care and cleaning... I cannot say the same for most others.

It is really off the point talking about what is the _maximum_ MIPs of a 030 machine. TT is likely to be less than 2.0 MIPs. Even if the CPU got a vast cache memory, the access time to the actual DRAM is often the decisive factor. Good CPU boards usually have 80-ns-4-MEGAbit DRAMs and when successive addresses are accessed the Column Address Strobe is repeated, reducing the access time dramatically. If these modern techniques are missing, the instructions already on the cache memory may be executed very fast, but the overall performance will be deadly slow.
I once used a 020 machine at 10 MHz but it was actually much slower than our ST because it had to be swapping memory to/from disks as it was a virtual memory machine!
The actual performance can be measured only by using a typical application program on them: I think my ST at 8 MHz is fast enough for my need.
Cheers,
Tsuji

I have now checked about 2/3 to 3/4 of all my floppies (a few
hundred). I found viruses on 6 disks (including the one I reported
earlier). The pattern of infection does NOT point to either the
June 1991 ST User magazine disk, nor to the 'only_ste.lzh' file.
Rather, it looks like I probably received an infected disk about
a year ago. Luckily, it just never had much of a chance to spread
on my disks. I won't go into why this is so. I have a fairly good
st dumb luck. It's probably a good
idea for everyone to check their disks anyway in case I'm wrong,
but I don't think there's anything particular to worry about.

>1 word number of color planes [1 for monochrome]
>1 word pattern length in bytes [1-8, usually 2 for screen images]

I've been meaning to ask this for a while now, and this seems
like a good time. What is this "pattern length" all about?
It can't be the length of the data bytes. That would be 32000 rather
than 2.

>1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
>1 word pixel height in microns

Does most software actually take this into account for anything
or can you leaave the pixel dimension 0?

>1 word line width in pixels
>1 word number of lines
>-------
>? words header length defined in 2nd word of header
>
>? bytes data
>
>NOTES: If the image is a color image (planes > 1), the planes are stored

>assume the header is 8 words long, always get the header length from the
>2nd word of the header. Also, the line width in the 7th word is the number

This is one of the reasons I'm making IFF/ILBM my main "supported
file type". No matter how you feel about the Amiga/Atari/Mac wars,
the IMG "standard" just isn't sufficiently defined and has not real
underlying rational. I don't know if I would embrace the whole of the

IFF standard -- it's really just a mish-mash. But the ILBM part
is rational and practical.

1) STacy's are not all that widespread. Last I heard, they still only had
their FCC Classification B rating. Meaning that they can only be sold for
professional purposes.

2) STacy's only come out in the last year or so. There's nothing to
replace them yet (for die-hard Atarians, anyway) so there's no reason to
sell one if you have one.

3) STacy's are excellent laptop computers. If I had one, I wouldn't sell
it either!

Hello All,

This is the list of dealers I have received so far.
They are in NO PARTICULAR ORDER, I just append incoming mail
to the end of this document. I did edit some of your mail messages
to keep it short, you can ask the companies questions as to
what they offer exactly. I am not responsible for the accuracy of the
information listed below and I am not in anyway affiliated with any of
the companies. Hope this helps everyone.

p.s. If you object to this posting, please flame me either on the net or
thru email, I would like any feedback you give me (positive | negative ;-)

>the driver and not over-rideable without writing your own driver.

I don't think the 68030 is responsible for the bus error. Remember that
the error is reported by the scsi controller. During dma transfer the 68030
is not active. I do use my own driver but there it is the same problem with the
original atari driver.
BTW, in AHDI 4.02 you still find an old error: After initialising the driver
exits with PTERMRES. Instead of specifying its length to stay resident it
uses its start adress as parameter for PTERMRES. The effect: after running
AHDI several times you run out of memory. The first time it is started you
loose about 64KBytes of RAM. This means that by using AHDI you have always
less memory than with other drivers (e.g. HDDRIVER).

> who's got this disk, beware.

I checked this out with George Woodside's VKILLER. My disk is clean.
It was formatted with Martin Backschat's FASTCOPY III, and has a
formatter ID of 'IBM' in bytes 3-5 of the bootsector, but the serial
number is OK - i.e. it doesn't correspond with an MS-DOS version number.

It looks like ST User is innocent this time. (Innocent of this, at
least. On the cover disk is what they call - several times - the 'very
latest version of UniTerm'. The version is in fact 2.0c. The last
version that Simon Poole released is, I believe, 2.0e011. 2.0c is quite
usable; if they didn't shout so much about the program being "hot from
the programmer's fingertips" - with a 1987 copyright date??? - I
wouldn't mind.)

| the disk I used the MSA.PRG auto-formatting command. It seems to
| me that this method of packaging might allow for transporting of
| boot sector or other viruses. Has anybody else unpacked this demo
| kit recently?

I just unpacked this demo for friends last nite! I don't have an STe
or MegaSTe, but I got 4 Mb and they were needed.

First off, I received only_ste.lzh through the News at work.
Unfortunately, only_ste.lzh is incompatible with MS-DOS compatible
floppy disks, since they're limited to 720 Kb. As a reminder,
only_ste.lzh is 802661 bytes long. What to do? I used "split" on my
SPARC to chop the file in half. Each half was put on a separate
floppy and taken home.

At home, I became worried about concatenating two binary file parts
together. I then decided to run full blown GNU emacs (not mg, jove,
nor micro-emacs) with a 1 Mb RAM disk. I then inserted into my emacs
buffer both halfs of the file and saved it to the RAM disk. Of course
there was no more room to unpack the file. It tested out okay. Well,
I copied it to a floppy and extracted back to the RAM disk. I then
ran MSA to create the demo floppy. Ouffhh!!! ;-|

The first thing I did then was to run VKILLER on it. It stated that
the floppy was executable, but no known virus was found!! 8-)

Did anyone have a much easier time of it? I only hope that few items
of this sort travel through USENET or are uploaded to atari.archive.
Normally, large *.lzh or *.zoo can be split up differently since the
individual member files are less than 720 Kb.

From: e4ct22@titan.hts.hsa.nl
Message-ID: <1442@titan.hts.hsa.nl>
Source record: 231713

We have got some problems with programming the SCC-chip on the
Atari-TT. We tried to programm it via DMA-SCC registers but it
didn't work. Who knows what we have to do with these registers\
or what the good method is of programming both the DMA-SCC registers
or the SCC directly.

>version" and so no sale. Does that sound extreme? Maybe, but that is what
>worries companies and that is what they are trying to prevent.
>

Surely any company that tries to produce and sell software that is not as
good as something an individual working on at home can produce and give
away does not deserve to remain in business. A software company does not
deserve to do well (ie make a lot of money) out of what must be a very
inferior product.

Although I have not personally seen the STrabble game in question, it
does not sound like a particularly difficult game to code (more difficult
getting the dictionary together I would have thought), and yet it is being
sold for the same price as some of the more complex games (anything involving
a lot of high speed graphics, say).

I therefore see the PD world as not only providing the "little" utilities
that are not worth writing yourself, and not worth paying money for, but
also for keeping the "Big" software houses "on their toes" and ensure
that their latest "masterpiece" is actually worth the money that they are
asking for it.

(What a rant !!!! Sorry about that)

Source record: 231708

Exacly the same problem I had....
I know of LOTS of examples of MEGA STE's with this bad chips that causes the monochrome diplay to wrap when you change screen adresse and causes static in the DMA sound, but Atari Corp won't confirm this and tell me that this is only a problem with my machine (but you are the 4th one I've heard about).
Replace the chip with a chip from an old STE (not the same number so you need the print-layouts for both MEGA STE and STE to do this, the chip is called GSTSHIFTER and has to do with both video and sound in the STE machines..)
I would again like a comment on this from Atari Corp. You can't just ignore this problem that applies to a great number og MEGA STE's !!!!!???

The exact procedure I followed was to run lharc on Unix (a DECstation
5000 unpacks LZH archives a *little* faster than an ST :-), split the
file in two, and then wrote the floppies. On the ST the easiest way I
found to do this was to `cat' the two parts (using GNU cat from
cs.uni-sb.de), a lot faster than creating a RAMdisk and using GNU
Emacs, I'd say...

> Did anyone have a much easier time of it? I only hope that few items
> of this sort travel through USENET or are uploaded to atari.archive.
> Normally, large *.lzh or *.zoo can be split up differently since the
> individual member files are less than 720 Kb.

The thing might be to have a simple stand-alone SPLIT/JOIN program on
the ST. If I knew more about GEM I'd do it myself (maybe I'll give it
a try someday). By "simple" I mean one that does NOTHING but the
equivalent of Unix's split and cat, ie. no headers or CRC's.

Anyway, regarding the only_ste demo, I must confess it's absolutely
fabulous.

>THIS IS NOT A FLAME (I am a ATARIAN and probably always will be)
>
>
> Jeff

Some particulars. Dynacadd ($1000 list, but available for about $550) handles drawings as well as Auto CAD. On a TT with a math coprocessor, it does an arbitrary rotation of the semi-standard space shuttle drawing in essentially human reaction time (not quite, but too fast to time conveniently). Last I heard, a '486 running Auto CAD took about 2 seconds. Pagestream and Calamus run at practical speeds on the TT; they are highly usable (I use Pagestream on a Mega, myself, and while it's highly functional, some text operations are slower than I'd like). The comparable programs for Intel chips, whatever their merits, just don't seem to get used. Similarly, because of the Atari-MIDI connection, there are good heavy-duty MIDI programs for the TT; in the 'mainstream', the word seems to be that for MIDI you get a Mac.

Pricing: we just saw a quote of $2100 for a stripped TT. That's '386 pricing. Similarly, the full configuration prices for the TT seem to be in the low $3000 range. Same comment.

Routine applications: my big routine application is chromatographic data processing. Big disk files going through once. Anything faster than a '386

25 runs i/o bound on this one, so all fast machines look the same. Any big math operation that has an inner loop that takes up residence in on-chip cache (and that's a lot of the market for cycles right there) is going to turn over amazing numbers of MIPS on any fast processor. The relative amazingness is going to depend on machine cycles per instruction (slight advantage to the '486 I believe) and efficiency of data addressing (slight advantage to the '030).

About that 2 MIPS for a 32 MHz '030 box: the TT needs some configuring to work at its best. This is new for Atari machines, but is old hat for other micros (and minis). Run a program with bad locality of addressing entirely out of RAM shared with video, maybe you can make it run that slowly. Unfortunately, unless someone tells the system not to, that's the RAM the program will use. And locality just wasn't the issue in 68000 programming that it is in 68030 programming, so lots of existing programs aren't ideal for the TT. Which comes to the old lament that the only real benchmark is YOUR application.

The BIG problem with the TT (and all machines Atari) is that the VARIETY of applications just isn't out there. The big applications are covered, but not with a whole lot of different choices. And Atari doesn't make it easy to develop for their newer machines (although they try to make up for it with their help once an application is developed).

I hate to argue in public. I'd have done this in email, but I think maybe this discussion might be worth keeping going.
Steve

4418. Questions on Desktop/Environment

Newsgroup: comp.sys.atari.st
Date: 1991-05-29 14:20:01 UTC
From: tnzoerne@faui09.informatik.uni-erlangen.de
Message-ID: <tnzoerne.675526801@faui09>
Source record: 231715

Question on Environment:

I am actually writing a program, that shall read some Variables
out of the environment. But I reckognized something very strange:
Desktop overgives the first called program the environment:

PATH=\0 (\0 means Nul-Char)
C:\\\0 (\\ means Backslash)
\0\0
trash...

Now I can't guess, what that second String could mean. It is *not*
dependent on the starting-directory. Maybe it shall be the Boot-
Directory ? But I load AUTO-Prgs. and DESKTOP.INF from Disk A: !!

That is also not the MS-DOS-Standard, as there after the twice-Nul-
Bytes the starting-directory should be overgiven, and before only
correct Definitions (including a '=').

Question on Accessories under Dektop:

Is there any way to reckognize from out of an Accessory if the
aktual process is the Desktop (when receiving an acc_open) ?
I want to write a program, that opens automatically a window on
the Desktop to display some things; but that shall not happen
in other programs. (Thats no problem in TOS-programs, cause you
don't happen to get an acc_open)

Perhaps some kind person has an idea and tells me about it ?

Thanks, little TOM

4419. Atari HD hostadapters/drivers.

Newsgroup: comp.sys.atari.st
Date: 1991-05-29 14:28:12 UTC
From: mbaker@ucs.adelaide.edu.au
Message-ID: <3444@sirius.ucs.adelaide.edu.au>
Source record: 231717
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings all!

I'm looking for some information on the available host adapters for the ST,
and also driver s/w.

Currently I am running a Megafile 30 adapter board and an NEC D3142
drive. Someone I know is looking for an RLL controller to talk to an RLL
CDC wren, and I want to sell my controller to this person.

This places me in a difficult position: I need to find a new controller.

My current unit took me 3 months and untold hassles with certain Oz atari
techs, and I don't really want to try this again.

An well, I have my eyes on another 3142, with which I hope to add a minix
filesystem to my machine.

Thus, I am seeking a hostadapter which will run RLL : the only possibilites
seem to me to be:

ICD + Adaptec 4000A.

Supra. (is this ACSI <-> RLL or ACSI <-> SCSI???)

Berkley Microsystems. (again, to what?? RLL? SCSI?)

Are there other hostadapters available??
Are they any good??
Costs??

Please, being hereunder in Oz, can I have some addresses for the
manufacturer or a dealer that will export here?

With regards to driver s/w, I understand that the Atari HDI will not support
more than one drive per LUN. - how about the Supra/ICD/Berkley drivers?

How about Claus' driver (CBHD) - cost, language, etc...

Many thanks all.

Matthew.

>>HAVE one yet?
>>
>Yes. Since September 1990. Most professional developers in Germany have one.

Yes! I waited 5 months - ordered it December 1, 1990. I was the first one to order and the first to receive (probably one of the first to receive here in the Chicago area - non developer machine that is) the TT at the dealer near me. I'm starting to see new software appear for the TT also. Such as: Lattice C TT, Calamus TT, Pagestream (?) TT, Devpac Assembler TT, etc....
By the way, did you see my posting to this newsgroup from a few days ago? Here's the info:

How's this: TT030, 4M, 50M HD, with Color Monitor - $2680
Subtract about $500 without Color Monitor. I believe that you can also get the 2M TT030 for just under $2000. A 4M model includes 2M of ST RAM on the motherboard plus another daughterboard with 2 more Meg. One can expand this ST RAM daughterboard to 10 M. The fast TT RAM includes another daughterboard with 1M Sims to add another 4M to make a TT030 8M model. Remove the 1M Sims from this TT daughterboard and replace them with 4M Sims to expand TT RAM to 16M. Result total RAM = 10 + 16 = 26M. I was told today from a dealer here in the Chicago area that these RAM expansion boards will be ready for sale around mid June here.

CUL,
Chuck

P.S. Software from my ST is running many times faster on the TT - to be expected! :)

Message-ID: <1991May29.152543.17264@msuinfo.cl.msu.edu>
Source record: 231718

An important note:

A 520ST is by definition an older machine. IT DOES NOT HAVE A DRIVE BUILT IN. If someone is selling you a 520ST find out if it is an STf (f for FLOPPY). Those are newer and have the built in drive.

Some of the last 520STf's (before they were discontinued) used 1040 motherboards. So, to upgrade to 1meg cost only price of a few chips (a friend did it for $30 in about 3hrs. Takes some soldering though. I DON'T HAVE DETAILS, so don't ask me how he did it.)

Good Luck with your ST. I love mine.... So, glad I dumped my Compaq Luggable...

Many thanks to all who replied. Apparently I received the Green Goblin virus on the ST User Magazine disk #58, December 1990. This was apparently a well known situation to those who read the magazine regularly. I never heard about it before.

I checked the rest of my disks and that particular disk did indeed have that virus on it.

Actually, I would have done exactly the same thing he did.
On any complex system you never know if it's fully debugged. If
you hit a key during boot, and there's a bug, you might just cause
a crash. There's no way to know. Unless told otherwise, the safest
thing to do while a system is trying to boot and just sit there
and stare at the screen.

>But where is any key located on your keyboard? I couldn't find it on mine. :-)

Well it's only on the North American versions. ;-)

4427. Milwaukee Area ST User Group

Newsgroup: comp.sys.atari.st
Date: 1991-05-29 18:55:30 UTC
From: baaa02@mixcom.COM
Message-ID: <872@mixcom.COM>
Source record: 231709

The Milwaukee Area ST User Group (M.A.S.T.) will be sponsoring an Atari Swapfest on June 2nd, 1991 in Milwaukee, WI.
We wish to thank the following developers and vendors for committing to attend the show:
Apple Annie Branch Always Software
Compu-Seller West Dennis Palumbo Fonts
G.K. Enterprises ICD
Innovative Concepts Kolputer Systems
Komtech Micro Magic
MissionWare Software M-S Designs
Paper Express SKware One
Taylor Ridge Books Timeworks
Toad Computers Touch Technologies
Other User Groups that will be attending;

LCACE MAAUG
GCACE RACC

M.A.S.T. also will have two tables set-up for selling used equipment both for our members and on a commission basis. There will be the new TT and Mega STe computers at the show. I have been assured that both machines are also for sale at the show.
We also will have the new Atari Coupon Books And Catalogs from E. Arthur Brown Available to the attendees.
We hope that you will be able to join us in Milwaukee for this show.
We will be updating this notice as we have more information.
Ticket cost is two dollars in advance, three dollars at the door.
If you need a hotel, please contact one of the following;

Hampton Inn (414) 466-8881 (limited double rooms)
Budgetel Inns (414) 535-1300 (single rooms only)

If you have any questions please feel free to call (414)463-9662.

Thank You

Bruce Welsch
President

I'm using version 2.0e011, and it has a 1986 copyright date. So maybe
2.0c _IS_ a newer version.

The more that games programming moves into the realm of higher level languages and away from the realm of arcane assembly language voodoo (heh-heh), the more you will see "individuals working at home" producing games that give the professional houses a run for their money.

I strongly suspect that in the next few years we will see many more games written by former "mere hobbyists" that are of professional or near-professional quality. The main thing that separates commercial games from those done by amateurs at this point is art. If you get two friends working together for fun on a PD game, one a programmer and one an artist, you can get amazing results that rival the professional games in quality. Don't think for a minute that algorithms to move shapes around the screen quickly are "secrets." There are already several examples of Shareware and PD games for the ST that "have the technology." Have a look at LLamatron or Nova.

Of course the professional houses will always have the edge in extremely complex games like flight simulators, Ultima N+1, etc. simply because games like that require huge amounts of data. But games in the "shoot everything that moves" and "ninja chop-socky warriors part 19: revenge of Foo" genres come down to basic straight-ahead game mechanics and glitzy art.

>Although I have not personally seen the STrabble game in question, it
>does not sound like a particularly difficult game to code (more difficult
>getting the dictionary together I would have thought), and yet it is being
>sold for the same price as some of the more complex games (anything involving
>a lot of high speed graphics, say).

Scrabble is QUITE difficult to do well. Not as hard as chess or go perhaps, but then there's quite a bit of literature written on those.

Making an intelligent Scrabble opponent has been the subject of at least one PhD dissertation. Add to that the difficulty of just getting the dictionary of words into the program in a space-efficient manner, and you've got quite a challenging project.

>I therefore see the PD world as not only providing the "little" utilities
>that are not worth writing yourself, and not worth paying money for, but
>also for keeping the "Big" software houses "on their toes" and ensure
>that their latest "masterpiece" is actually worth the money that they are
>asking for it.

There's absolutely nothing wrong with writing a game that rivals professional games in quality. The problem comes when you cause the professional software houses to lose sales on their own products because you copied them. That's the main issue here -- that STrabble performs all the functions of a commercial Scrabble playing program (and quite brilliantly, I might add) and therefore steals sales from the people who bought the rights to produce the official version. If STrabble were a game only _similar_ to Scrabble, then Spears would just be out of luck, but then STrabble probably wouldn't hurt Spears' sales if it weren't an implementation of the famous board game.

Like Neil, I think that Spears have every legal right to ask Warwick to stop distributing the game. (Note that I said _legal_ right.) However, it IS an unfortunate trend. It makes me unhappy to see someone who is just trying to provide quality software to the ST community essentially for free getting raked over the coals for it. On the other hand, however, if I were Spears and saw that my sales were being hurt after I'd shelled out the bucks to write the legitimate version, I'd probably feel that trying to stop distribution of the shareware version were my only recourse.

If Scrabble were a game no one cared about any more (like Pacman), I'm sure this wouldn't even be an issue. The problem comes when a shareware author copies a game that still has sales potential. The big bombshell in this area is of course Tetris. It's a simple concept that is unbelievably easy to implement. Easier, even, than Pacman. Since it's so easy, it's been copied all across creation. But this does indeed affect sales of the official versions, and sure enough, Spectrum Holobyte (supposedly) attempted to kill all the shareware versions of Tetris for the Amiga. (Perhaps an Amiga owner will correct me if it wasn't Spectrum Holobyte.)

To see things from the other side, ponder this: How would you feel if you'd come up with the idea for Tetris, written the game and put it out there (commercially), only to come across equally good PD rip-offs of YOUR game idea?

Copyrights and patents are intended to protect intellectual property. The fact that the laws are only severely enforced when someone else is getting hurt by an infringement is a virtue that allows people to have an ancient (but fun) game like Pacman or Robotron on their ST's even

after there's no commercial potential for it. Who would write Pacman for the ST if it could only be released commercially? It just wouldn't sell.

This whole legal mess should be taken VERY seriously by PD/Shareware authors. Whereas shareware and PD started out as a vehicle for hobbyists to release anything they wanted to, it has now become a threat to big business. Shareware authors should realize they're now walking through a legal mine field when they infringe on others' copyrights.

4432. detecting GDOS and using vst_load_fonts

Newsgroup: comp.sys.atari.st
Date: 1991-05-29 21:09:58 UTC
From: steve@thelake.mn.org
Message-ID: <A1899828925@thelake.mn.org>
Source record: 231726
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

(This is a repost ... because of a configuration error, the original may
not have achieved the distribution I had intended.)

I'm having trouble figuring out how to use an alternate font
to draw text in a GEM window. I presume I need to check for
the existence of GDOS before calling vst_load_fonts, but
how?

I'm also getting three bombs when calling vst_load_fonts, with
AMCLITE installed and ASSIGN.SYS set up properly (or at least well
enough that GEMINI doesn't complain).

I'd like to install Gemini 9 pt inside an application program.
Do I need to search for "Gemini 9 pt" in the data returned by
vqt_name() or do I search for the filename "BAGE09.FNT"?

Code fragment follows:

```
open_vwork()
{
int i;
char tmpln[80];
handle = graf_handle( &char_w, &char_h, &box_w, &box_h);
for( i=0; i<10; work_in[i++] = 1 );
work_in[10] = 2;
v_opnvwk( work_in, &handle, work_out);
fonts_loaded = work_out[10];
sprintf(tmpln,"[1][There are %d|fonts available][OK]",fonts_loaded);
form_alert(1,tmpln);
/* note: it tells me I have one font available */
fonts_loaded = vst_load_fonts(handle,2);
/* BOOM! Three big ones and we go no further */
sprintf(tmpln,"[1][After vst_load_fonts,|there are %d|fonts available][OK]",fonts_loaded);
form_alert(1,tmpln);
if (fonts_loaded > 1)
set_font();
}

set_font()
{
/* Wouldn't it be nice if there were a font selector like the
file selector? (Volunteers?) */
int i,fontindex;
```

```
char fontname[32];
char *p = "BAGE09.FNT"; /* or should it be "Gemini 9"? */
if (form_alert(2,"[1][Load BAGE09.FNT?][Yes|No]") == 2)
return;
for (i=0;i<fonts_loaded;i++)
{
/* find the font */
fontindex = vqt_name(handle,i,fontname);
if(strnicmp(p,fontname,strlen(p))== 0)
{
/* select the font */
vst_font(handle,fontindex);
/* set the point size */
vst_point(handle,9,&char_w, &char_h, &box_w, &box_h);
return;
}
}
}
```

Correct me if I'm wrong, but I think the original Tetris WAS PD, and the
folks that have been making money on high-quality professional implementations
don't deserve a copyright on the original innovation.

4436. 1040STfm repair/upgrade

Newsgroup: comp.sys.atari.st
Date: 1991-05-29 22:52:29 UTC
From: briant@tsltor.uucp
Message-ID: <1991May29.225229.10554@tsltor.uucp>
Source record: 231724

Greetings netlanders and sundry ST hacks,

My ST keyboard has a strange malady. Namely the '/', 'CR', '\' and
DELETE key require me to hold them down for an eternity or bang on them with
a sledgehammer to get them to work.

Bottom line, I probably want to have it fixed or figure out how to
do it myself. I'm tempted to upgrade to the latest version of TOS (I have
an old '86 TOS1.0) and probably upgrade my memory to something that lets
me use a few of the neat tools (e.g., MiNT) that are out there and still
be productive.

Any solutions (including "don't be stupid, you'd save money by buying
a Mega from XXX for $$$ because your upgrade would cost $$$'") would be
gratefully received. Recommended repair folks/dealers/others in the Toronto
(where I work) or Guelph (where I live) would be great.

Best Regards and many thanks,

Brian

As usual, you're wrong. I'd be happy to tell you in email, but you don't seem to like receiving email from people who tell you you're wrong. Freedom of stupidity, I guess. Your loss.

The rights to Tetris are owned by a Russian company who sells it to various other companies. I recall a court case recently in which Nintendo forced Tengen (a subsid. of Atari Games, which isn't related to Atari Corporation anymore) to stop selling a Tetris game. Nintendo had licensed it directly from the Rusians, while Tengen had sub-licensed it from a British company who owned the "home computer" rights.

Source record: 231741

I don't know what's going on here. After receiving the 26
uuencoded parts I tested the 'only_ste.lzh' file with 'fstlzh20'
and it passed. So I unpacked the files and it turns out to be
'msa.prg' and 'only_ste.msa'. Ok. So I ran the 'msa' program
and in theory I unpacked the disk. It turns out that on that
"huge" disk there were only a few files, none of which was all
that big. Is this some kind of joke? I think I could repackage
all the relevant files in a single LZH file of about 40K.

I've passed the disks on to a fellow who works at a store
that sells STEs and he's going to report back to me around the
end of the week. Has anybody finished testing this thing?

Ralph is right.
One does not need such a complicated script. UUD will ignore the
parts that it does not need. It jumps from the "include", past
the mail or news header, and straight to the next "begin" line.
A good command line might be like this:

```
cat somebigf.u?? | uud
```

Silvert's adaptation of the Dumas' code is great.
Highly recommended.

Hello Graham,
The early Ste's are all covered on a case to case basis..
Your supposed to call atari if you find out your STe doesnt work with a hard drive for some reason. (Yes, atari USA did say there was a problem but all current STe's should be working just fine. The problem was NOT with JUST the third party drives although they seemed more apt to mess up.)
I would suggest making sure your hard drive is very backed up...
My bosses computer didnt start trashing files until about a week after he had the computer. He swapped it and it has worked every since.
(Atari USA's customer service told me the above policy. I decided to wait until later. Glad I did. I am gonna try getting a new machine pretty soon)

From the discussion on c.s.a.st a while back with Alan Pratt, I believe he said that you can only have 4MB _ST_ ram. You can have 16 MB TTram like you said, but that the other 6MB of ram comes from using the VME bus for ram expansion. In fact, the VME ram is supposed to be faster than STram (no sharing it with video, etc.), even though it is slower than TT ram. However, I wonder why you are limited to only 6MB from the VME? Is it Atari being silly and not allowing you to use _most_ of the '030's addressing capability (of course SOME of it has to be reserved for I/O etc. but not more than 32k worth!) like they did with the ST (you know - the 68k can address 16MB but you are limited to using 4MB max - I mean, even if you dedicated 512k to I/O,ROM,etc. you could put in 15 1/2 MB around it. It would be worth it to use 4-4MB SIMMs as you would only be losing the use of 1/8 of one of the SIMMs (actually 1/16 of two of them)).

4445. assorted TT questions

Newsgroup: comp.sys.atari.st
Date: 1991-05-30 07:19:09 UTC
From: meulenbr@cst.prl.philips.nl
Message-ID: <meulenbr.675587949@cstw163>
Source record: 231660

Hi,

I'm in the process of convincing myself to buy a TT, and I'm stuck with
the following questions:

As I'm told the TT does not have a 68882 on board, but does have
a socket for such a beast. Right?
What speed must this beast have, or can is the speed selectable?
the 68881 and 68882 are supposed to be compatible. I owe a 68881.
Can I use that one instead (assuming it is the right speed).

I'm a little puzzled by a previous posting about how memory is
implemented. Are there two different daugtherboards??
If I buy a 2 MB system is it then just a case to add sims if I want to
upgrade to 4 MB? If not, I think I'll prefer to buy a 4 MB system.
Is such a 4 MB system easily upgradable (e.g. by adding (or maybe
replacing) simms). From a previous posting I concluded that there is
a different daugther board if you go to 8MB. Is the ram on the
second daughter board faster than on the first one??

What speed is the ram actually. Do I get wait states when accessing the
memory? In any of the above cases??

Then there is the monitor. Is it possible to use an ST monitor if the
screen is in an ST resolution??
I think the price on a TT monitor is on the high side. However, I'm
told that this is just a regular VGA monitor. Can I go out and buy a VGA
monitor and use it?
I assume I need a monitor with 640x480 resolution and 60 or 70 hz
refresh rate, and a D connector plug (forgotten the number of pins).
Do I need a color monitor, or can I also use a monochrome monitor.
Using a monochrome monitor would cut the price with $ 200 or $ 250, and
I do not really need color.

If someone could answer these questions that would be very appreciated.

Thanks!

>>Is there any way to reckognize from out of an Accessory if the
>>aktual process is the Desktop (when receiving an acc_open) ?
>
>No legal way, unfortunately. (Correct me if I'm wrong.)

OK :-)
BTW: Atari UK say this is 'OK' to talk about.

When an accessory is starting up it should get the address of the OS header at $4F2. This usually points to the start of the ROM, wherever it is, but AHDI might change it. Either way what it points to is, or should be, consistant.

At $28 offset from the start of the structure $4f2 points to is a pointer to the process ID of the current process. This is actually its basepage.

For an accessory that is starting up this will be the PID of the GEM Desktop since accessories are not processes in the true sense, ie. they belong to the AES and Desktop.

The accessory can save this PID and compare it to the current value when the accessory is activated from the menu. If it's the same then we are on the desktop. If not then we are in a program. Actually this is quite handy for adding modules to an existing program.

Caveat:
This PID pointer does not exist in TOS 1.0. For that ROM version its value is 0x602C execpt for the Spanish ROM where it is at 0x873C.
The TOS version is found at offset $2 from the start of the OS header and the country is encoded at offset $1C but the lowest bit is screen freq.

eg.

```
; long *get_pid()
; Return PID pointer for any ROM version.
; (Note: Call this in Super mode for access to _sysbase)

SPA: EQU 4 ; Spain country code

_sysbase: EQU $4F2

_get_pid:: MOVE.L _sysbase,A0 ; A0 -> OS header
CMP.W #$0100,2(A0) ; Is this the old TOS?
BEQ.S .old
```

```
MOVE.L $28(A0),D0 ; D0 = PID address in modern ROMs
BRA.S .done

.old: MOVE.W $1C(A0),D0 ; D0 = Country and screen freq.
LSR.W #1,D0 ; D0 = Country code
CMP.W #SPA,D0 ; Is it Spain?
BNE.S .other

MOVE.L #$873C,D0 ; D0 = Spanish PID
BRA.S .done

.other: MOVE.L #$602C,D0 ; D0 = Rest of the world PID

.done: RTS ; return(D0);

END

Note the complete lack of XBRA usage in the above example! :-)

Were you trying to run zoo from the desktop and do you have TOS 1.0?
The TOS 1.0 desktop converts all TTP parameters to uppercase. So,
instead of zoo seeing a -x option, it sees -X which it doesn't
understand. Try using a CLI (one that doesn't convert parameters to

>
>Can I further the request, and ask what Atari magazine readers of the net
>find most useful? If possible, could someone post/send addresses for
>those magazines?

I recommend ST Applications. After the demise of ST World, it evolved
from a PD newsletter, into a magazine. Even though STW is coming back, STA
has the edge as the best serious ST publication for the ST. (IMHO)

The address is,
ST Club,
49 Stoney Street,
Nottingham,
NG1 1LX
England.
Tel: 0602-410241

And subsciption costs are,
UK 15 pounds
Europe 18 pounds (Air Mail)
Worldwide 28 pounds (Air Mail)

Lee.

No doubt a major part of the problem was that the name "STrabble" would
almost certainly be considered an infringement of Spear's trademark. Had the
game been called something else then the company would probably not have
taken an interest. In court they'd simply have to show the product was
"passing off" rather than get into the intricacies of copyright that
Brad mentioned.

4452. Sleeping GEM

Newsgroup: comp.sys.atari.st
Date: 1991-05-30 13:48:47 UTC
From: hofmann@cbnewse.att.com
Message-ID: <1991May30.134847.949@cbnewse.att.com>
Source record: 231653
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have written a GEM application that launches a long running
application, writting text output to one window and graphs to
other windows. This works fine, except that - after running awhile -
the computer halts. It stays halted until the mouse is moved.
The mouse pointer is converted to a bee while the application is
running and back to a pointer when it re-enters the event_multi loop.
When the program locks up, the mouse pointer is still a bee. I am
running this on a Mega ST2, TOS 1.4, Viking Moniterm monitor.
Is this a known problem? Are there workarounds?

Any insight into this problem would be appreciated!

From: SYSPMZT@gecrdvm1.crd.ge.com
Message-ID: <91150.100511SYSPMZT@GECRDVM1.BITNET>
Source record: 231683

With the imminent demise of my external B drive (likes to misread directories, and goes into a long pause at access time most of time, successful or not), I'm going to finally break down and purchase a hard drive. I recently bought a 1040 STe, and am running Rainbow TOS (1.6?).

Can anyone post/mail considerations on the various options available to me? I can live with 20 meg, though 30 or 40 would be more appealing. Cost is important, and I'm suprised at the expense of most of the drives the latest STart listed. My friend was able to purhase a 105M drive for his Mac for little more than most 30M Atari drives are listed. Is there any way I can take advantage of SCSI technology? Any recommendations on inexpensive yet trustworthy dealers to buy this from? What are the software requirements for formatting a hard drive and backing up a hard drive? I assume that any drive I purchase will include that software, but is there a standard (pd?) application that I should/want to have?

I apologize for my naive and encompassing questions, and truly appreciate any assistance I might receive. If anyone's noticed me in this category lately, they'll know that I started by asking if I should buy a Mega or a 1040. The responses to those questions directed me to buy a new 1040 STe and upgrade the memory to 4M myself, at ****CONSIDERABLE**** savings. I hate to be an information leach, but you Netters really know what you're doing, and I surely don't.

Many thanks in advance,

Phil Z

As an aside:

I play the PD Tetris and Arkanoid games rather than the commercial ones.

Why?

Because I have a monochrome monitor.

If the software companies are so lazy that they won't make their games run on my computer, well, I'll just have to use the superior PD programs.

I think (no guarantees) that the commercial Scrabble game is colour-only. It certainly looks that way from the box.

>"huge" disk there were only a few files, none of which was all
>that big. Is this some kind of joke? I think I could repackage
>all the relevant files in a single LZH file of about 40K.

Since it's a pity if anyone with an STe would miss this
beautiful demo I'll explain in some more detail how to unpack it:

1. Transfer only_ste.lzh to your system
2. Unpack the archive using lharc

This will give you two files:

a. only_ste.msa
b. msa.prg

There is no documentation included for the msa.prg.

Now execute msa.prg and press the disk-->file button. It will
change to file-->disk. Insert an empty floppy in your disk drive
and press the F:\FILENAME.MSA button to select the only_ste.msa
file which you have unpacked previously.

Finally press the DOIT button and the msa file will be unpacked
to a full floppy disk image.

As Jim Omura mentioned a listing of the files on A:\ will only show
an auto folder and three or four other files.

At this stage do a soft reset (!).

After the intro screen has been build up hit space and while
a message and credits story will flow over your screen you can
select one out of two modes using arrow up or down.

The top mode (sorry, I forgot the exact name) is the music demo.
The bottom mode is a music sample editor (called Esion).

If you select the editor you'll return to the desktop and you can
execute the program esion.prg on A:\.

4457. What's a fair comparison?

Newsgroup: comp.sys.atari.st
Date: 1991-05-30 14:50:23 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991May30.145023.1684@chinet.chi.il.us>
Source record: 231696

I seem to be involved in what is fast becoming a shouting match about relative price and performance of Atari computers vs those based on Intel chips. One of the main problems is knowing what to compare with which. So how about we pick some fair yardsticks. Atari isn't 'Joes Garage Computer Manufactorie', and shouldn't have prices compared with it. I'll suggest ZEOS as a company whose prices are widely advertized, and whose quality is comparable to Atari (I rate both of them very good for service, by the way. Start your own thread if you want to talk about service). Often as not, ZEOS machines are the least expensive ones included in those comparative reviews magazines have so much fun with. Cross-platform benchmarks are damn near impossible (Byte magazine has had several articles on the subject), but I'll modestly propose as a benchmark the time for GNU C to compile itself, with all temporary files on hard disk. Any other suggestions?

Ok now: I personally have none of these things: GNU C source distribution, TT or 80486 box. The people I know who have them I trouble enough over more serious issues. Anyone care to post about how long it takes GNU C to compile itself on the TT?
Steve saj@chinet.chi.il.us

I should follow up, as this isn't quite correct. Actually, the offending
software was the MACCEL mouse accelerator that Dr. T shipped as pd with
KCS Omega. I'll miss the speed, but it was corrupting all sorts of
software. I can't tell you if it would have on old TOS as I only started
using it when I got my 1040STe (my old 1040 ST wouldn't read it's internal
drive, so I had no ACC's or AUTO things loaded).

CAL50 seems to run alright, although with other windowing software it seems
to have problems keeping the mouse pointer visible on the screen.

It's really hard to figure out who or what's causing a problem in the moving
target public domain software world...

```
Protect6 - The resident bootsector/linkvirus detect/kill program
""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""

Well... Uhhh.... Hmmm...

OK, so the first version of Protect6 didn't stop all the link-
viruses :-( Because of some strange features in the GEMDOS
it is possible to WRITE data to a file that i OPENed as READ ONLY.
This should give an error from GEMDOS, but it doesn't. Some link-
viruses opens the program file from READ ONLY and then use WRITE.
(does Atari Corp have a comment on why this is possible !!!????)
As the first version of Protect6 checked for OPENing of a program
file for READ & WRITE or WRITE ONLY these viruses get passed it.

Well, this new version of Protect6 (check your date) uses a
completly different way of checking things. I also removed
the XBRA stuff. Why? Well, any virus could use the XBRA stuff
to un-hook Protect6 from the OS-vectors and disable Protect6 !

I've seen quite a number of references to viruses, and to a program called VKILLER. Is this a public domain program? I've been downloading quite a bit of software recently, and it scares me to think that something corrupting may have come along with one of the files. It's doubly scary to hear that a disk included with ST User may have included a virus.

Any suggestions of precautions/checks I should routinely be taking to avoid problems? I've been having trouble with intermitent corrupted 3 1/2" directories, and this has me worrying.

Gosh, just what I need: a new way to be paranoid.

Thanks,

Phil Z

4461. Rodneys uucp

Newsgroup: comp.sys.atari.st

Has anyone who has used Rodneys Uucp package been able to
have it retrieve files from a remote site.

Example:
on the remote side > uucp -r foo hoser\!~
queue up foo on the remote side.
from hoser > poll remote
hoser logs on to remote and gets file foo.
file foo should go into remotes public directory which
is c:\etc\spool\uucp\remote BUT it goes into c:\etc\spool\mqueue as
~a/weirdname and any files that may have been queued along with foo
with just overwrite this file. I would appreciate any help.
I probably need to explicitly tell the remote where to put the file.

4467. Help requested with BMS 200 + Quantum pro drive

Newsgroup: comp.sys.atari.st
Date: 1991-05-30 18:19:59 UTC
From: acton@cs.ubc.ca
Message-ID: <1991May30.181959.23362@cs.ubc.ca>
Source record: 231657

I am writing this note on behalf of a friend so I may be a little confused on some of the details. My friend recently acquired a Quantum Pro Drive 40 SCSI hard disk for use with his Atari 1040 ST of early 1988 vintage. He also got a BMS 200 from someone who was getting rid of their Atari system. Unfortunately he is not having very much luck getting this combination to work. He can format, partition and mount the disk but any files copied to the disk are corrupted. If the file is a text file every now and then one of the characters is replaced with a " (intuition suggests this happens every 2048 characters). Executables larger than 2048 bytes execute for a bit and then crash with 3 bombs, smaller executables work fine. My guess is that the program has finally got around to executing one of the corrupted bytes when it crashes. So the questions:

1) Has anyone got one of these Quantum Pro Drives (it is from a NeXT machine) to work with the BMS 200 and if so what did you have to do and what version of the BMS software are you using? (This disk has a cache just in case that is causing problems.)

2) Just in case no one can help, is Berkeley Microsystems reachable by email and if so what is their email address?

4468. TT/68882

Newsgroup: comp.sys.atari.st
Date: 1991-05-30 19:05:37 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <27361@know.pws.bull.com>
Source record: 231659

One netter asked if the TT includes the 68882; mine did and the TT manual stated that it is a TT standard feature, not an option. It has a clock speed of 32MHz, just like the 68030. The MegaSTE manual states that the 68881 is an option. Note, for firm believers that Atari never delivers; THIS MESSAGE CREATED ON A TT. Now, if only the software base would expand (yeah, I know I can run Macware, after all I use GCR!!!!!).

> Highly recommended.

Bill's version works fine, but I also have an older UUD that chokes
if there's too much junk between include and begin.

Remember the GEM-based uuencoder/uudecoder that I mentioned I was
working on? Somehow, in ripping the decoder out of WD.C, I managed
to break that feature; my program now won't manage concatenated files
that include lots of trash. As soon as I have the right combination
of spare time and caffeine I should be able to get it fixed and post
the program to comp.binaries and comp.souces.

>than 2.

"pattern length" means the fill-pattern. As it looks, you can define your own
fill patterns and save them with your IMG-file. As you may know, standard
fill patterns are 16 pixel wide, so it's the 2 for two bytes.
>
>>1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
>>1 word pixel height in microns
>
> Does most software actually take this into account for anything
>or can you leaave the pixel dimension 0?

When you are using your ATARI for publishing, you will need this information
for restoring the original size of your IMG. In CALAMUS (SL Version is on the
run since this week) you have a function for restoring this, but it will only
work, if you have inserted the correct data. Please do so.

4471. COMP: TADS: The Text Adventure Development System

Newsgroup: comp.sys.atari.st
Date: 1991-05-30 21:39:29 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1991May30.213929.6204@watmath.waterloo.edu>
Source record: 231697
Cross-posted to: rec.games.design,comp.sys.atari.st

If you're interested in creating Infocom-like text-only adventures on your home computer, TADS is a great start.
The package does all the parsing and defines most of the common adventure verbs and item types in editable include files.

TADS is a shareware object-oriented programming tool for the Atari ST, Macintosh, and IBM PC Compatible (MS-DOS/PC-DOS) which is available from High Energy Software, P.O. Box 50422, Palo Alto, CA 94303.
(Atari users can try out atari/games/tads/tads.lzh on atari.archive.umich.edu)

For my $25 US, I got the TADS Author's Manual, a sample game, updated versions of the include files and programs, and a tool for combining the game runner and game into a single file.

I am pleased with the quality of the manual, the response to the question I asked with my payment, and the complexity and flexibility that the package allows.

I would like to get together with other TADS users even on different platforms since a game written for the Atari can be compiled on all three systems.

Sample simple adventure:
****

```
#include <adv.t>
#include <std.t>

fireVerb: deepverb
verb = 'fire' 'shoot' 'blast'
sdesc = "fire"
doAction = 'Fire'
;

/* This is where you start the game. */
startroom: room
sdesc = "Hallway"
ldesc = "You are in the hallway. There is an room to the east. "
east = engineroom
;

engineroom: room
sdesc = "Engine Room"
ldesc = "You are in the engine room. The only exit is to the west. "
west = startroom
;
```

```
/* The engine can not be taken since it is a fixed item. */
engine: fixeditem
sdesc = "diesel engine"
ldesc = "It's an old-fashioned diesel engine. You can't imagine how it
runs this spaceship. "
location = engineroom
noun = 'engine'
adjective = 'diesel' 'old-fashioned' 'spaceship'
;

/* The slime gun starts out in your possession. */
slimegun: item
shotsleft = 6
sdesc = "slime gun"
ldesc = "It's standard equipment in the Denebian Space Patrol. "
location = Me
noun = 'gun' 'pistol' 'blaster'
adjective = 'slime' 'space' 'denebian'

/* Don't allow the gun to be dropped. */
/* ver = verify, do = direct object */
verDoDrop( actor ) =
{
"You can't leave the gun here. ";
}

/* Allow the gun to be fired if you still have slime. */
verDoFire( actor ) =
{
if ( self.shotsleft < 1 )
{
"No more slime left.";
}
}
doFire( actor ) =
{
/* Decrement number of shots left. */
self.shotsleft := self.shotsleft - 1;
/* If I'm not in the engine room */
if ( Me.location <> engineroom )
{
"You get slime all over yourself.";
}
else
{
"The slime clogs up the engine and the spaceship explodes.";
die();
}
}
;
```

****
WARNING: The following is probably only interesting to TADS users.
****

> Marvin, pick up the paper

Although the TADS parser recognizes the actor Marvin, most of the
standard responses assume Me was the actor.
e.g. "You don't see the paper." instead of "Marvin doesn't see the paper."

I have spent a great deal of time editting ADV.T changing
"You" to "caps(); actor.sdesc;" and
and "don't" to :

```
if ( actor = Me ) {
{
"don't";
}
else
{
"doesn't";
}
```

plus similiar changes for "your", "are", "see", "have", etc.

While I was at it, I reorganized the file into functions, prepositions,
verbs, and items alphabetically unless there was a better ordering
plus cleaned up the indentation and brace style and a few typos.

Before I mail the file back to the authors, are there any other suggestions?

Even though I have made all these changes and allowed my actors in my game
to pick up items, I keep getting an error from "Marvin, pick up the paper"
which usually says that I am trying to compare two different data types
in a comparison. However, "give paper to Marvin" works fine. Any ideas?

Dani Roloson

From the TADS manual (please read carefully):

(Like all TADS limits, this can be changed at compile-time with user-specified
compiler options; of course, string space is also limited by the amount of
computer in your memory, which you unfortunately cannot change with compiler
options.

Some of the benchmarks people commonly use are Dhrystone (integer performance), Whetstone (Floating point performance), Linpack (Floating point performance), Livermore loops (Floating point performance), SpecMark (Overall system performance, but belongs to SPEC Inc). The advantage of using these is that you don't have to re-do the benchmarks on the other machines, which you might not own. I've seen dhrystone for the ST, maybe at atari.archive?

4475. Stupid question on using ARC for the ST

Newsgroup: comp.sys.atari.st
Date: 1991-05-30 22:39:15 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <42805@cup.portal.com>
Source record: 231655

Like the title says, this is a simple, stupid question...

I downloaded a file called ARCsomething.TTP, and need to know the syntax for using it. I tried all the possible combinations I could think of, but theres obviously one I cant think of. I dont quite recall the exact full name of the program, but it was something like arc v6. If someone could help me out, mail me the doc file, etc, Id like that :-)

Also, a similar note. I downloaded another file called arcsh20.prg, but when I double-click on it, it gives me a TOS error #35.

No flames please, I am totally new to the Atari ST computer world, so I still am getting used to the way things are done...

Thanx

>what's going on here?

You're seeing effects of the death of the Atari marketplace in the US.
There are no longer enough Atari users or advertisers to support large
"glossy" magazines. There are still a few smaller magazines trying to
support the market, but they may be hard to find.

Atari Interface magazine is available at many B.Dalton Bookseller stores, as
well as WaldenSoftware stores, and many Atari dealers (if you can find one).

>has had several articles on the subject), but I'll modestly propose as a
>benchmark the time for GNU C to compile itself, with all temporary files on
>hard disk. Any other suggestions?

benchmarking is often serious stuff, at least at the level i deal with.
so, you must also post guidelines like 1) all tmp files to single n sized
(empty) partition, 2) hd seed rate should be included in results, 3) non-
standard clock speed, 4) version of GNU C (which can't be enhanced),
5) compiler switches, etc, etc, etc...

as u can see, to truly make objective comparisons you have to be thorough.
in general, benchmarks including compiles are less desirable (yes, even
SPECmark) since you more often than not compare compilers not systems.
dhrystone is notorious for this (i have seen *widely* varying DS for
exactly the same hardware, just different compilers). i think you are
better off with real or near-real applications and just use the fastest
compiler for that system. report the compiler as well. at least with
real applications, users have a better feel more often than not.

i would also try to exercise different aspects of an architecture: raw
cpu, data/instruction cache, i/o, screen writes, etc. fortunately (???)
the TOS ST is not multitasking (really) so that at least there are no
issues like throughput vs single job times :-)

in general, the more information the better. try to avoid single number
performance indeces. let the user make up his own mind. his/her application
may be totally different than yours...

>a socket for such a beast. Right?

No the 68882 is standard (however, it may be in a socket...?).

>What speed must this beast have, or can is the speed selectable?
>the 68881 and 68882 are supposed to be compatible. I owe a 68881.
>Can I use that one instead (assuming it is the right speed).

The 68882, like the 68030, runs at 32 MHz.

>I'm a little puzzled by a previous posting about how memory is
>implemented. Are there two different daugtherboards??
>If I buy a 2 MB system is it then just a case to add sims if I want to
>upgrade to 4 MB? If not, I think I'll prefer to buy a 4 MB system.
>Is such a 4 MB system easily upgradable (e.g. by adding (or maybe
>replacing) simms). From a previous posting I concluded that there is
>a different daugther board if you go to 8MB. Is the ram on the
>second daughter board faster than on the first one??

Ok. The two basic memory types are ST and TT ram. ST ram is located on the mother board (I believe that there is 2MB soldered and 2MB socketed which are empty if you get a 2MB TT or a 4MBTT with 2MB TTram) and doesn't need a daughterboard. TT ram does need a Daughter board (its more than just a bunch of SIMM sockets - it also has a chip that allows access to the TT memory). The TT daughterboard holds 4 SIMMS - up to 16MB max (using 4MB SIMMS). Using the card slot inside the machine, you can add a memory board for even more memory. However, in neither case is it simply a matter of slapping SIMMS into your machine (unless you already have the TT daugterboard).

>
>What speed is the ram actually. Do I get wait states when accessing the
>memory? In any of the above cases??

Since the machine runs at 32MHz, I assume that there are at least 1 wait state on all memory, the TT ram having less than the ST ram.

>
>Then there is the monitor. Is it possible to use an ST monitor if the
>screen is in an ST resolution??

No. Even though the TT displays ST resolutions, it does it on the same
signal that displays the TT's special resolutions.

>I think the price on a TT monitor is on the high side. However, I'm
>told that this is just a regular VGA monitor. Can I go out and buy a VGA

>
>Are you kidding? You must be kidding!

Time for a few "mouse basics". I can believe that Michel is
very happy with his mouse. I'm very happy with my own mouse too.
I think you seem to be saying that you were not happy with yours.
Well, first, not all Atari mice are the same. For the record,
mine is a "Made in Japan", serial number P1595168339. I've been
told that this was the best series of mice that Atari ever used.
I clean it periodically and it keeps on working fine. It is
perfectly even in response and the click response is fine in most
situations, subject to proper adjustment via the Control Panel.
I don't need a mouse accelerator for my work.

Now, some of the later mice had various problems. At least
1 series of mice would not respond evenly in all directions. The
classic is when you find the cursor doesn't move left as fast as
it moves right. Others are apparently flimsy and don't last.
Furthermore, if you work on a monochrome screen (and particularly
the larger Moniterms) you will find that my mouse would suddenly
feel too slow. That's because the system software doesn't adjust
the response to act proportionally in that manner, so even though
my mouse is fine for me, I could give you my mouse and you'd still
not be happy for that reason. A variable speed mouse accelerator
tends to be a better solution for this than a new mouse though.
At least for some people this is true.

And then there's the surface you work on. I don't use a
"mouse pad". I've tried some and they didn't feel very good. What
I do use is a sheet of old paper to run the mouse on. It allows
the ball to grip well enough without affecting the overall feel.

And then again, even aside from all that, you might not like
my mouse and I might not like one that you like. That's just
taste.

Cross-posted to: comp.sys.atari.st,uw.sys.atari,ont.micro

Compuserve can be accessed via Datapac (in most Ontario towns) or
Tymnet (in Kitchener & Ottawa and one or two others) for the rip-off
fee of about $9 USD/hour.

CIS also has an 800 number which is apparently cheaper at certain times.

NOte that it is also less than $9/hour to call Toronto on the phone
system on weekends and after 11.

You can also get a datapac NUI and do outdial in Toronto for
something around $5-6/hour, I think.

I've had a megafile 30 for about a year, and the only complaint
I've had is the loud fan. Is it really needed, or will the
drive run cool enough without it? Are there any ways to quiet the
fan, maybe replacing it with a quieter one?

THanks,
Chris

I wouldn't be suprised - the IBM version only uses CGA (the lowest of the lows).

This does show how poor the implementation is. I wrote STrabble in mono first,
then spent 2 days converting it to colour. It can only be described as poor
programming not to be so flexible.

Hey, and get this: The IBM version had music and beeps!
I was soooooo impressed :-).

Ciao,
Warwick.

Here, in Vancouver, $3000 is in the 486/386-33 range. Of course, that's with an 80Mb Hard Drive, VGA 1024X768 1Mb Ram video card, and 1-4Mb's or RAM. The TT on the other hand costs just as much for a lot less. A 386-22 w/VGA, 100+Mb hard disk, etc. is now $1900. All prices are in Canadian dollars aswell, so that would be around $1650US. It looks as if Atari is cutting itself short .. again.

ATARI is not cheap anymore "POWER WITHOUT THE PRICE" now it should be said "PRICE WITHOUT THE POWER". In my store I sell the 486-33 for alot cheaper than that. My 486 systems start at $2275 with HD and monitor, and I seen them alot cheaper in mags., you just have to look for them. By the way what is 386-22? or do you mean 386-33.

I wanted to state that the following was mine opinion, this is not to cause any flames. After posting this I realize perhaps people may get the wrong idea. Someone has already sent mail stating how I am against ATARI, WRONG, I am interested in purchasing a TT and this is how I can learn from people posting the reasons and why the TT is worth purchasing. I don't plan on spending close to 3000 on a system in which I am unaware of things. I must know all point of views and try to get ATARIANS to respond. AS for against ATARI I have been in flame wars before in defense of ATARI against many other system users, but only to get involved when I see someone stating incorrect claims. (TT = i486-25 for example).

For any users that might have been Atari 8-bit users at one time, the
MSA (Magic Shadow Archiving) works in the same way as DISCOMM or Scrunch -
it simply takes data from the whole disk (including boot sectors) and
puts it into a file, so it can be transmitted via modem. Then when the
file is received, you just reverse the process and unpack it to a full
disk, boot and all. For some programs and demos, this is the only
way to go about it (say an author doesn't want you messing with his/her
data (by loading a file into an editor such as Edhack) - so he/she
wipes out the directory and makes the program autobooting - kinda
a method of file protection...

At first I thought the same and replaced a better fan, which made no
difference (human feel the noise is reduced to half when it is reduced to
one tenth). I then added a couple of diodes along the 12 V line to the fan
to reduce the voltage and turn the fan slower. This didn't make a difference
either. I then bought another 5.25" disk second hand (66 MB at US$150) which
is reputed to be the least noisy. The noise has been reduced to half, but
it was still roaring!
I then bought a 3.5" disk of the same specification at the same price. The
noise has been reduced quite substantially now. But I must say it is still
noisier than ordinary 104 MB SCSI drives.

The megafile30's original drive was a seagate thing and got heated very
easily. People sometimes sticks a very think fan on the drive mechanism
directly,but the casing of megafile30 does not allow this.

A warining: a 3.5" drive cannot be replaced on the 5.25" mounting.

Tsuji

For all of those out there who appear to believe that the grass is greener in other computer pastures for small developers, I refer them to the July 1991 issue of Macworld, wherein Steven Levy writes an article titled "The Rime of the Ancient Marketer: a cautionary tale for little guys in the Mac marketplace".

Several quotes of interest:

"I don't know if any small companies will be around soon," he told me. "Nine companies sell over 90 percent of the software, and over a hundred are fighting for the rest."

"But not everything was rosy. Apple had just instituted a policy that required developers to pay $750 for the privilege of being authorized to write the software that would support the Mac."

Caveat emptor.

> support the market, but they may be hard to find.

Not exactly true, Bob. ST Log was making money when it was folded into ANALOG, and was still making money when the publisher decided to discontinue publishing the magazine. Likewise, STart's parent company was still making money from the magazine --- it was 'killed' by cash draw-off to other publications within the same company (or so I am led to believe from the conflicting press reports to which I've had access.)

It wasn't from lack of subscribers OR advertisers that these magazines died -- it was a decision by the publishers to put their money into other endeavors.

As for other "glossy" magazines, both ST User and ST Format (from England) have been selling well in my own neck of the woods -- I imagine that quite a large number of folks wouldn't mind a subscription service for either (ie. import the magazines from England, ship them to subscribers in the United States). I find them interesting enough to devote the $7.95 + tax that my local ST dealer charges for them each month.

4502. ASV - first impressions...

Newsgroup: comp.sys.atari.st
Date: 1991-05-31 11:28:07 UTC
From: hb9zz@bernina.ethz.ch
Message-ID: <1991May31.112807.19817@bernina.ethz.ch>
Source record: 231551

Here in Zurich there has been the anual logic computer show. There have
been several new very interesting products to see, in particular a series
of new Unix machines in the "popular" class. The first I've seen is the
Mac with A/UX 2.1. It isn't yet a SYSV, and there are some compatibility
problems, but the BSD and SYSV libraries are included, and the integration
of MultiFinder and Unix with X Window 11R4 is really impressive. I find
they are really on the good way. I've been there during about 15-20 min,
and Dr. Antonov, the Unix Guru there, I think, explained me every detail
with enourmous enthusiasm. Althougth I don't have a Mac, and the price of
A/UX 2.1 is to high for me (not to speek about the X Win., wich is not
bundled with), his presentation was fantastic.
The second system I've seen is the Amiga 3000UX. It was also really
impressive! The OpenLook interface operated exactly the same way as the
Sun's OpenWindows 2.0 we have at school, and the price was really interesting
too. The Commodore port of SYSV is the most complete I've seen for this class
of machines. It comes with everything, from the networking capabilities
to the BSD lib. and util. and OpenLook. The guy there is a student of
economical computing at the Univ. ZH (his name is Blatter), and he let me
"play" with the machine, showed me an xterm connection with another non
Unix Amiga, and so on.
At last I came to the Arari boots and I couldn't belive my (x)eyes.
The Unix machine was there and there was nobody around it!!!
The windowing interface looked great. I went there and tried some commands
out in a csh, as the cd, ls, and so on. Then came a man, and with an impolite
voice asked me :"kann ich Ihnen helfen?" (can I help you?) and stand in front
of me so that I could not see the screen! The message was clear: Take your
hands off my machine and get out of here! I asked him some details about the
new machine (btw: how can an atari laser work with Unix w/o stopping the
processor? I think it is impossible by soft) and his answer were allways very
expeditive and short. Absolutely no enthusiasm from his side! The only thing
he wanted was that nobody put his finger on thekeyboard! (he maybe was afraid
that somebody typed "rm -r /" or something like that). Anyway he stood all the
time with his shoulder between me and the screen!
His name is Mr. Mester, from Atari Germany. I personnaly find that if they
sent some young guy involved in the devloppent of ASV, instead of this dick
pig, it would be much better. (Sorry for title on this bandwidth, but he
was really dick and had a face of a pig!)
If this is the Atari policy I think I'll buy an Amiga 3000 UX, wich is btw
ready and can be bought w/o problems (atari devlopper machine will be out
in August!!!).
Ok, that's all! I'm sorry to write something like that, 'cause I was really
excited at the idea I could see the ASV jewell, but it wasn't what I
expected.
I hoped that I could write a good description of what I would see, but I

didn't see very much...

Ciao --- Rick

4503. Problems with GDOS and HD driver (again)

Newsgroup: comp.sys.atari.st
Date: 1991-05-31 12:22:54 UTC
From: s_kraemer@iravcl.ira.uka.de
Message-ID: <1991May31.132254.1@iravcl.ira.uka.de>
Source record: 231700

I've got problems using GDOS (AMCGDOS) with the harddisk driver of my vortex HDplus 20 (hardware: Mega ST 2 with TOS 1.4).

GDOS works if I don't use the harddisk, so I guess the problem is the disk driver. (The path in ASSIGN.SYS seems to be correct).

Does anybody know how to solve this? Or can I use another HD driver without getting into trouble?

Thanks for information!

X FILE.ARC - will extract all files from archive
X FILE.ARC FOO.BAR - will extract file FOO.BAR from srchive
L FILE.ARC - will list files in archive (or is that `V' ?)

By the way, 6.02 is (I think) the latest version of ARC.

> Also, a similar note. I downloaded another file called arcsh20.prg,
> but when I double-click on it, it gives me a TOS error #35.

You may have forgotten to set the transfer mode to binary when you downloaded.

4506. What's a fair comparison

Newsgroup: comp.sys.atari.st
Date: 1991-05-31 13:39:01 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <27484@know.pws.bull.com>
Source record: 231555

A fair comparison is made the same way a person compairs stereo systems. The manufacturer hits you with a lot of specs. However, the true test is to bring a favourite disc, play it on the new system and if it sounds great and is in your price range buy it.

Same is true for buying a computer. Forget MIPS. Decide on the applications that you're interested in and see how similar apps perform on different platforms. For example, WINDOWS 3 may LOOK great on a superVGA monitor; however, just compare speed and easy of use of MS Word, EXCEL, PageMaker, etc on Macs and 386s/Windows running these apps and you'll see that for sheere productivity the Mac wins hands down (especially when it comes to getting your printed copy). Go ahead, spend some time in computer stores running apps on various platforms - that's the FAIR comparison!!!

Computer loyalty runs deeper and stronger than car loyalty. Just because someone says he loves a Mac, Atari, Amiga or PC does not mean that the same system is good for you. I sell Atari computers but often recommend that the client get a Mac; sometimes even a PC if he/she HAS to run some specialized software for the PC (normally, though, I warn novices about the complications of setting up a PC - ever install PC codes???)

Novices should be advised of one thing; often the seller has absolutely no ability to give you proper advice. Often he/she may be selling a system that he/she hates but the job calls for SELL, SELL, SELL. Do not be bullied into getting a system that suits someone else.

>In order to access Compuserve in Ontario, do you have to make long-distance
>calls to Toronto?

No, you can use Datapac, which charges a connect-time fee that is comparable to the discounted (2/3 off) rate for LD to Toronto. It's been some time since I used either CI$ or DP, but I do remember that the information for doing so is on-line. All you have to do is specify a port that connects you to CI$ and then go through the logon sequence (oh yeah, last time I was at Waterloo there was Datapac availble through a CALL XXX from the campus terminals and also through a dial-in number).

Sorry that it's been too long for me to come up with specifics.

>Is it possible to get a listing of available Compuserve files and
>mail order them from Compuserve?

Never heard of this. You might want to check out QuickCis which (again going completely on memory) does automatic searching for downloads (and news meassages and e-mail). It should be on atari.archive.

>What is Compuserve's position on a non-member paying a member for the time
>and trouble of downloading selected files?

The distribution of files I assume is under the conditions set by the author (for example PD, etc). CI$ only has the right to charge for connect time used to download. This effectively puts a fee on something that the author is offering free of charge, but once its on your media you can follow the author`s licence. So CI$ really has no say in what a member does with a program after receiving it (and I don't think they really care).

So if you pay someone to use THEIR connect time to do something for you I don't think they care. It's the CONNECT TIME that is charged for, not the actual material being downloaded.

>Please email.

Would if I could. Wouldn't get outside of the city limits if I tried, though.

>Dani Roloson

Caveat - if you are used to downloading from BBS systems, be prepared for an unpleasant suprise. Instead of the alternating RD/SD you are used to on your modem's front panel, you'll get a lot of dead time as other users' on the system get their time slice. Downloads can be frustratingly slow even at 2400 bd (my modem's speed). And slow on CI$ means EXPENSIVE.

brad

|> fan, maybe replacing it with a quieter one?
|>

Hello Chris!
I think you need the fan, because those Seagate drives in the MEGAFILE 30
can get hot. Here in Germany are kit's aviable to make the fan not so loud.
First of all you can remove the lattice behind the fan. I heard of some
people that solder a resistor in the power connection of the fan.
I have a little kit, that turns the fan only on, if it is to hot in the
drive. You need nothing to solder for that one.

4509. The Current Market

Newsgroup: comp.sys.atari.st
Date: 1991-05-31 14:41:27 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991May31.144127.19756@lsuc.on.ca>
Source record: 231584

These are just some random observations about the current market and definitely NOT a complete overview of what's happening in the Toronto area:

Long & McQuaide North is a music store -- NOT a computer store, but they had a stack of 1040STEs and has sold them all. Obviously if a music store with no real computer people can sell 1040STEs there's a market for STEs.

Comspec, a computer store next door to L&M has discontinued stocking Atari products completely. That's not much of a loss to the Atari community. Comspec has always preferred Amigas and would go to great lengths to sell Amigas at the expense of ST sales. Still, I agree with a lot of the things Comspec has to say about the current Atari Corp. and the Canadian situation. I'm not at all happy about the current trend in Atari to "pull out of Canada" and leave us with a warehouse and repair department. Though I plan to do development on the ST for the immediate future, if things don't turn around on this matter I'll probably move on to another platform.

CompuPlace is strange. I've always felt they were strange and now their getting even stranger. Not bad, mind you, but if you look at the software they carry, I just don't know why they get in what they do. The best thing they have lately is a good supply of the British magazines. That and they have 2 of the better flight simulators. They have Proflight (British simulator of the Tornado that's supposed to be really good) and the F-19 pseudo-simulator (simulating a non- existant plane is, well, interesting). They are essentially out of stock of 1040STE's but will be getting more.

I have been hearing rumours that Atari has really been jerking around the dealers with the recent price drops. I hope this isn't true.

>

I know that linpack (which used to be considered the great 'real-world'
benchmark) is no longer considered a fair comparison of machines because it's
too architecture-sensitive (especially to cache and super-scalar aspects).
Whetstone never seems to have caught on for micros, perhaps someone knows
why and will say. I guess Byte eventually picked a suite of benchmarks,
which they make available in source, but they hedged pretty heavily about
counting on them across architectures. I'm assuming that the people who
participate in this discussion have some applications that exercise a processor
pretty thoroughly, and might be considered as successors to Linpack.
For what it's worth, I talked to a friend who rides herd on some big iron,
and he says that simply saying that beyond a certain machine speed my biggest
application (chromatographic data processing) is disk-bound sounds like a
benchmark to him. I disagree, but I'll toss it into the discussion.

Compuserve has local number in Canadian cities than can be accessed without long distance charges. The communications surcharge for using the CIS network is less than a dollar an hour over and above the Compuserve charges (like about $.25)

I can't say anything about other cities, but Ottawa has 1200 and 2400 bps connections.

If you're in a hurry, log on to Compuserve any way you can, then GO PHONES where you can search by city, area code, or speed.

Now that's getting down right, uh, not-very-intelligent.
Anybody with enough knowledge to analyse an object code file
probably has sufficient tools to read sectors anyway. For
the rest of us who have no intention of playing with their
object code they do us the great honour of create a situation
where virus distribution can increase. All we need now is
somebody forging a copy of this 'only_ste' demo kit with a
virus in place of the original boot sector and dozens of
STE owners are going to find themselves doubting the wisdom
of their purchases.

While we're on the topic of viruses, I was very impressed with
the "finish" of VKiller. It got me to thinking about such programs.
VKiller identifies ST boot sectors and where possible specifically
identifies viruses. But even the warning about boot sectors is
well done. I was just thinking that many of us use Atari ST's in
"mixed environments" with MS-DOS machines and it would be helpful
if VKiller identified MS-DOS boot sectors as well. I wouldn't go
so far as to try and keep up with the MS-DOS virus situation completely,
but just give a warning like this:

"MS-DOS Executable boot sector found. If this disk was not supposed
to have one, you might want to discuss this with whomever supplied
the disk."

That way you could alert an MS-DOS user that s/he might have
a virus.

In article <9105082156.aa25310@Bonnie.ics.uci.edu>, bferrer@Bonnie.ICS.UCI.EDU says:
>
> After downloading the gcc compiler and getting very thing ready, I came
>across another problem. When I type in gulam gcc -v hello.c, I get an error:
>
>can't find d:\tmp/cc100000.s
>
>or something like that. gcc created a file that has a slash in the filename
>which does not exist how can i fix this error.

Whilst apratt, entropy, bammi and davidli are all correct in observing that the GNU environment variables need setting correctly, I believe that this is *NOT* the case for this poster and that pointed references to "RTFR" may have been a little harsh.

I got *exactly* the same problem --- but with *all* the enviroment variables correctly set --- boy, was I confused before I figured out what I'd done ...

I had d/l'ed gcc139b.lzh from terminator and (deliberately neglecting to keep copies of the previous port) unarchived the replacement code straight into my c:/gnu directory, including the CRC-corrupted cc1, the corruption of which lharc reported, but it nevertheless wrote the file.

The corruption was reported here, but a correction wasn't immediately available (no criticism intended). I never followed this up until recently, when I had occasion to test a gnumake port which resulted in the now-familiar

"can't find c:/usr/tmp/cc100000.s" message

If you use the original corrupted distribution (i.e. without replacing the gcc-cc1.ttp with the updated version from a.a.umich.edu), GCC reports that it is unable to find $TMP/cc100000.s --- because the corrupt cc1 has the -quiet flag automatically set, it crashes and exits quietly, never writing the .s file, hence the 'cannot find" error.

I d/'ed the corrected distribution of cc1 from a.a.u.e and the problem vanished.

I checked the posters' queries and they were both quoting problems with "$TEMP/cc100000.s", which should have tipped us off; "$TEMP/cc100000.cpp"
^ ^^^
(the first temp file to be written) is normally associated with environment variable problems. Having a missing .s file means that a .cpp file was found by cc1.

Question: Does gcc139b.lzh on a.a.u.e contain the corrupted or uncorrupted gcc-cc1.ttp? It's not immediately obvious because both versions of cc1 are exactly the same byte size.

No! If you want to follow the path of your mouse-cursor, you may do a
event-multi call with parameter MU_M1 (Mouse-Event 1). Just set the width and
height of the rectangle to 1 pixel and if you move the mouse and the cursor
leaves the rectangle, you'll recieve a MU_M1-Event.

>It wasn't from lack of subscribers OR advertisers that these magazines died --
>it was a decision by the publishers to put their money into other endeavors.
>

It most certainly was. Look at the number and size of ads in thier final issue. The total advertsing revenue from those is insignificant relative to the cost of producing a glossy. I know of at least three writers for STart that Antic Publishing owes over $3000 each with no ability or intention to pay. They don't have any money left to divert to other endevors.

Read the full page editorial in STart's final issue explaining thier decision to go bimonthly. Paraphrased from thier own words, the logic goes like this:

1) No users = No software sales
2) No software sales = No developers
3) No developers = No advertsing
4) No advertising = No magazine

Regardless of personnal opinion of the quality of journalism provided by STart, the loss of the last domestically produced glossy is not a good sign for the health of the US Atari community. Unfortunately, it is not the only bad sign.

Yes, they do. However, the CDAR504 was never offered to public and has been discountinued. The 505 was reported been shown in computer show and suppose to be release to public soon. You can find more about 505 in various ST magazines that has detail report on the past CeBiT (hope I spelled it right) show.(Like the free ATARI USER magaize, the Znet on-line).
Maybe Alan or Atari willing to shine some more light on the specifications and possible CD-ROM titles for 505?

4518. Neophyte question: what's Blitter?

Newsgroup: comp.sys.atari.st
Date: 1991-05-31 17:03:49 UTC
From: darkstar@milton.u.washington.edu
Message-ID: <1991May31.170349.15843@milton.u.washington.edu>
Source record: 231566

We are the very new (3 days) owners of an Atari 1040 STe.
There is a toggle on the options menu for something called Blitter.
The little manual has no reference to it at all. Can anyone enlighten
us as to the meaning of this option?

Thank you very much

Alden F.M. Hackmann

I hope Jeff won't object to my disclosing a specific issue he mentioned to me in email; it will help people identify what might interest him.

One of his major applications is animated graphics, for which he is prepared to write his own code. To me, that sounds like a set-up in favor of the TT. If anyone has benchmarks or pointers to tools directly relating to animated graphics, this might be a good time to mention them.

What I'll mention is that there's said to be an awesome TT demo (about an hour's download time worth of it) recently put up on GEnie by Bob Brodie. I won't see it myself for a while, but perhaps someone has more to say about it?

4522. Gemini Standard Usages

Newsgroup: comp.sys.atari.st
Date: 1991-05-31 18:43:17 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991May31.184317.26514@lsuc.on.ca>
Source record: 231585

I've been working with Gemini off and on for a while now and
I hope somebody can pass these comments to the programming team.
It's all regarding the "mupfel.mup" file:

HOME is defined as the current "gemini" directory. This is
a bad practice. You should tell people to define "HOME" to
their current "working directory", whereever that is.
On a Unix system, my normal HOME directory would generally
be something like "/usr/mygroup/jimomura". This is the directory
in which I do my usual work. The thing to emphasize is that
it has *nothing* to do with the operating system or executables.
In fact, it's mainly just text data files of my own concern.
If you don't learn this concept early on your going to scr*w up
your system organization by writing programs that look to the
wrong places for the wrong things.

Also, I have no idea what they are intending to use the "CDPATH"
for. I've never seen it on a Unix system or an OS-9 system and
I don't know what program would look for it. Is that supposed to
be a path for CD Rom applications?

I have been trying to get GDOS drivers for my HP Deskjet for "ever"
it seems, and now have given up the search (No, I haven't ordered one from
Migraph, please read rest of note) to await the arrival of FSM-GDOS.

Questions:
1) When will it be relesed ?

2) Who will handle distribution (Atari Directly, or through dealers, mail
order, ...)?

3) What will it cost, and will it include (as I have heard rumoured) drivers
for most printers including the HP DeskJet (original version)?

4) Can I get it now by buying Goldeaf's Wordflair II?

5) Will this guy ever run out of questions? Why ask why? Why is the sky blue....

Thanks in advance for whatever information you can provide!
I would assume posting replies should be appropriate, since I am sure
that many would like to hear more details about FSM-GDOS!!!!

> Steven Ourada

Unix System V Release 4 is available for TT. The package consists of
TT 030/8 or higher (16 Mb would be quite good), harddisk bigger than
200Mb (I'm not quite sure of this), X-Windows, TTM 194 19" MC-monitor
and a big bunch of software and manuals.
I don't know the exact price, but it is much lower than the NeXT Station,
and A 3000 & Unix SVR4.

Just checked, the harddisk is 200Mb, and there are also VME Ethernet network
card, OSF/Motif, and GNU package (with C, C++ etc.).

My personal opinion is that you should get a harddisk of at least 400Mb and
minimum 16Mb of total RAM to run this Unix well enough (=fast enough).

A friend of mine told me that his Unix workstation has a 1.2Gb hd and it is
just about enough... But it has it's own nntp package and mail handler.

I have to disagree. You must have been supplied witha faulty mouse. The Atari mouse is lightweight and easy to use. The mouse never moved too slow for me. Like you said, a mouse accelerator is easily obtained if the mouse moves exceedingly slow for you.
I cannot understand what you don't like about the Atari mouse! let me say that I am by no means a mouse connoisseur, for I have only fondled two mice: Macintosh and Atari ST. Macintosh, in my opinion, are heavy and unresponsive. I click, but I get no confirmation onscreen. I despise the recessed single button.

The Atari ST is easy to move, responsive, and suits my needs. I have felt no urge to get a replacement mouse.

RE>creates .sit and .hqx extensions.
RE>
RE>Does anybody know of any way I can uncompress these files on either my
RE>ST or a unix system (before down loading) ?

Nope. .sit is the extension from the Mac Packer StuffIt and .hqx ist from
BinHex (something like uuencode or btoa).
As far as I know the only possibility for you to unpack that stuff is somebody
with a Mac or Spectre and the needed programs. :-(

4530. Lynx and sega

Newsgroup: comp.sys.atari.st
Date: 1991-05-31 23:47:05 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991May31.234705.17779@terminator.cc.umich.edu>
Source record: 231582

Has anyone seen the commercial for sega's new portable game machine?
Color graphics that, at least on tv, look comperable to the lynx.
Could spell trouble for one of the better selling atari machines.
